

**DS90UB947-Q1** 

ZHCSD36A - NOVEMBER 2014-REVISED MARCH 2019

# DS90UB947-Q1 1080p OpenLDI 到 FPD-Link III 串行器

# 1 特性

- 符合面向汽车应用的 AEC-Q100 标准
  - 器件温度等级 2: -40°C 至 +105°C, T₄
- 支持高达 170 MHz 的时钟频率,可实现 WUXGA (1920x1200) 和 1080p60 分辨率和 24 位色深
- 单路和双路 FPD-Link Ⅲ 输出
  - 单链路: 高达 96MHz 的像素时钟
  - 双链路: 高达 170MHz 的像素时钟
- 单通道和双通道 OpenLDI (LVDS) 接收器
  - 可配置的 18 位 RGB 或 24 位 RGB
- 高速反向通道,支持高达 2Mbps 的 GPIO
- 具有自动温度和老化补偿功能,支持长达 15 米的 电缆
- 具有 1Mbps 快速模式增强版的 I2C(主/从)
- SPI 直通接口
- 向后兼容 DS90UB926Q-Q1 和 DS90UB928Q-Q1 FPD-Link III 解串器

# 2 应用

- 汽车信息娱乐:
  - 车载信息娱乐 (IVI) 主机和人机交互界面 (HMI) 模块
  - 后座娱乐系统
  - 数字仪表组
- 安全和监控摄像头

## 3 说明

DS90UB947-Q1 是一款 OpenLDI 到 FPD-Link III 桥接器件,与 FPD-Link IIIDS90UB940-Q1/DS90UB948-Q1解串器配合使用,可通过经济高效的 50Ω 单端同轴电缆或 100Ω 差分屏蔽双绞线 (STP) 电缆提供单通道或双通道高速串行流。它对 OpenLDI 输入进行串行化处理,支持高达 WUXGA 和 1080p60 的视频分辨率(24 位色深)。

FPD-Link III 接口支持通过同一条差分链路进行视频和音频数据传输以及全双工控制(包括 I2C 和 SPI 通信)。通过两个差分对实现视频数据和控制的整合可减小互连线尺寸和重量,并简化系统设计。通过使用低压差分信令、数据换序和随机生成更大限度地减少了电磁干扰 (EMI)。在向后兼容模式下,该器件在单一差分链路上最高可支持 WXGA 和 720p 分辨率(24 位色深)。

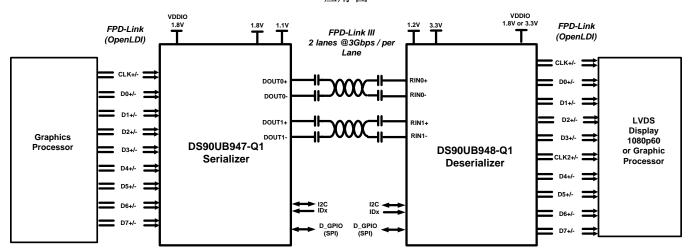

DS90UB947-Q1 支持通过外部 I2S 接口接收多通道音频。该器件接收的音频数据会被加密并通过 FPD-Link III 接口发送出去,之后再由解串器重新生成。

# 器件信息<sup>(1)</sup>

| 器件型号         | 封装        | 封装尺寸 (标称值)      |
|--------------|-----------|-----------------|
| DS90UB947-Q1 | VQFN (64) | 9.00mm x 9.00mm |

(1) 如需了解所有可用封装,请参阅数据表末尾的可订购产品附录。

# 4 修订历史记录

| С | hanges from Original (November 2014) to Revision A  | Page |
|---|---|------|
| • | Added T <sub>CLH1/2</sub> and T <sub>CHL1/2</sub> parameters to the <i>Recommended Operating Conditions</i> table           | 6    |
| • | Change I <sub>TJIT</sub> specification from min to max and added test conditions to the AC Electrical Characteristics table | 9    |
| • | Removed t <sub>PLD</sub> Max specification in the AC Electrical Characteristics table                                       | 9    |
| • | Added additional HSCC information to the SPI Mode Configuration section   | 22   |
| • | Changed register information about GPIO0 modes x00 and x10  | 42   |
| • | Changed register information about GPIO1 modes x00 and x10  | 43   |
| • | Added registers 0x40, 0x41, 0x42  | 52   |
| • | Changed register 0x4F[7] information  | 53   |
| • | Changed register 0x4F[5] information  | 53   |
| • | Added page 0x10 registers   | 66   |
| • | Added information to Power-Up Requirements and PDB Pin section  | 72   |

# 5 Pin Configuration and Functions

### **Pin Functions**

<sup>(1)</sup> Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

|                    | J                                       |   |  | VALUE  | UNIT |
|--------------------|---|---|--|--------|------|
|                    |   | Human body model (HBM), per AEC HBM ESD Classification Level 2  | C Q100-002 <sup>(1)</sup>  | ±2000  |      |
|                    |   | Charged device model (CDM), per AEC Q100-011<br>CDM ESD Classification Level C5                               |  | ±750   |      |
| V <sub>(ESD)</sub> | Electrostatic discharge (IEC 61000-4-2) | (IEC 61000-4-2)   | Air Discharge (D <sub>OUT0+</sub> , D <sub>OUT0-</sub> , D <sub>OUT1+</sub> , D <sub>OUT1-</sub> )     | ±15000 | v    |
| V (ESD)            | Licenostatic discharge                  | $R_D = 330 \ \Omega, \ C_S = 150 \ pF$  | Contact Discharge (D <sub>OUT0+</sub> , D <sub>OUT0-</sub> , D <sub>OUT1-</sub> , D <sub>OUT1-</sub> ) | ±8000  | V    |
|                    | $R_D = 3$                               | (ISO10605)<br>$R_D = 330 \Omega$ , $C_S = 150 pF$   | Air Discharge (D <sub>OUT0+</sub> , D <sub>OUT0-</sub> , D <sub>OUT1+</sub> , D <sub>OUT1-</sub> )     | ±15000 |      |
|                    |   | $R_D = 330 \Omega_2$ , $C_S = 150 \text{ pF}$<br>$R_D = 2 \text{ k}\Omega$ , $C_S = 150 \text{ pF}$ or 330 pF | Contact Discharge (D <sub>OUT0+</sub> , D <sub>OUT0-</sub> , D <sub>OUT1-</sub> , D <sub>OUT1-</sub> ) | ±8000  |      |

<sup>(1)</sup> AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

# 6.3 Recommended Operating Conditions

|                   |  | MIN            | NOM | MAX   | UNIT |
|-------------------|--|----------------|-----|-------|------|
| V <sub>DD11</sub> | Supply Voltage   | 1.045          | 1.1 | 1.155 | V    |
| $V_{DD18}$        | Supply Voltage   | 1.71           | 1.8 | 1.89  | V    |
| $V_{DDIO}$        | LVCMOS Supply Voltage  | 1.71           | 1.8 | 1.89  | V    |
|                   | V <sub>DDI2C</sub> , 1.8-V Operation   | 1.71           | 1.8 | 1.89  | V    |
|                   | V <sub>DDI2C</sub> , 3.3-V Operation   | 3.135          | 3.3 | 3.465 | V    |
| T <sub>A</sub>    | Operating Free Air Temperature   | -40            | 25  | 105   | °C   |
| T <sub>CLH1</sub> | Allowable ending ambient temperature for continuous PLL lock when ambient temperature is rising under the following condition: -40°C ≤ starting ambient temperature (T <sub>S</sub> ) < 0°C. <sup>(1)</sup>                                  | T <sub>S</sub> |     | 80    | °C   |
| T <sub>CLH2</sub> | Allowable ending ambient temperature for continuous PLL lock when ambient temperature is rising under the following condition: $0^{\circ}\text{C} \leq \text{starting ambient temperature} \ (T_{\text{S}}) \leq 105^{\circ}\text{C}.^{(1)}$ | T <sub>S</sub> |     | 105   | °C   |

<sup>(1)</sup> The input and output PLLs are calibrated at the ambient start up temperature (T<sub>S</sub>) when the device is powered on or when reset using the PDB pin. The PLLs will stay locked up to the specified ending temperature. A more detailed description can be found in "Handling System Temperature Ramps on the DS90Ux949, DS90Ux929 and DS90Ux947".

<sup>(2)</sup> For soldering specifications, see product folder at www.ti.com and Absolute Maximum Ratings for Soldering (SNOA549).

### 7.1 Overview

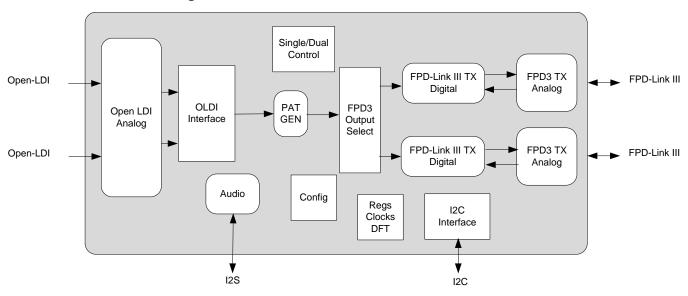

The DS90UB947-Q1 converts a single or dual FPD-Link (Open LDI) interface (up to 8 LVDS lanes + 1 clock) to an FPD-Link III interface. This device transmits a 35-bit symbol over a single serial pair operating up to 3.36Gbps line rate, or two serial pairs operating up to 2.975Gbps line rate. The serial stream contains an embedded clock, video control signals, RGB video data, and audio data. The payload is DC-balanced to enhance signal quality and support AC coupling.

The DS90UB947-Q1 serializer is intended for use with a DS90UB926Q-Q1, DS90UB928Q-Q1, DS90UB940-Q1, DS90UB948-Q1 deserializer.

The DS90UB947-Q1 serializer and companion deserializer incorporate an I2C compatible interface. The I2C compatible interface allows programming of serializer or deserializer devices from a local host controller. In addition, the devices incorporate a bidirectional control channel (BCC) that allows communication between serializer/deserializer as well as remote I2C slave devices.

The bidirectional control channel (BCC) is implemented via embedded signaling in the high-speed forward channel (serializer to deserializer) combined with lower speed signaling in the reverse channel (deserializer to serializer). Through this interface, the BCC provides a mechanism to bridge I2C transactions across the serial link from one I2C bus to another. The implementation allows for arbitration with other I2C compatible masters at either side of the serial link.

# 7.2 Functional Block Diagram

# 7.3 Feature Description

# 7.3.1 High-Speed Forward Channel Data Transfer

The High-Speed Forward Channel is composed of 35 bits of data containing RGB data, sync signals, I2C, GPIOs, and I2S audio transmitted from serializer to deserializer. Figure 12 shows the serial stream per clock cycle. This data payload is optimized for signal transmission over an AC coupled link. Data is randomized, balanced and scrambled.

Figure 12. FPD-Link III Serial Stream

The device supports OpenLDI clocks in the range of 25 MHz to 96 MHz over one lane, or 50 MHz to 170 MHz over two lanes. The FPD-Link III serial stream rate is 3.36 Gbps maximum (875 Mbps minimum), or 2.975 Gbps maximum per lane (875 Mbps minimum) when transmitting over both lanes.

### 7.3.2 Back Channel Data Transfer

The Backward Channel provides bidirectional communication between the display and host processor. The information is carried from the deserializer to the serializer as serial frames. The back channel control data is transferred over both serial links along with the high-speed forward data, DC balance coding and embedded clock information. This architecture provides a backward path across the serial link together with a high-speed forward channel. The back channel contains the I2C, CRC and 4 bits of standard GPIO information with 5, 10, or 20 Mbps line rate (configured by the compatible deserializer).

# 7.3.3 FPD-Link III Port Register Access

The DS90UB947-Q1 contains two downstream ports, therefore some registers must be duplicated to allow control and monitoring of the two ports. To facilitate this, a TX\_PORT\_SEL register controls access to the two sets of registers. Registers that are shared between ports (not duplicated) will be available independent of the settings in the TX\_PORT\_SEL register.

Setting the TX\_PORT0\_SEL or TX\_PORT1\_SEL bit will allow a read of the register for the selected port. If both bits are set, port1 registers will be returned. Writes will occur to ports for which the select bit is set, allowing simultaneous writes to both ports if both select bits are set.

Setting the PORT1\_I2C\_EN bit will enable a second I<sup>2</sup>C slave address, allowing access to the second port registers through the second I<sup>2</sup>C address. If this bit is set, the TX\_PORT0\_SEL and TX\_PORT1\_SEL bits will be ignored.

### 7.3.4 OpenLDI Input Frame and Color Bit Mapping Select

The DS90UB947-Q1 can be configured to accept 24-bit color (8-bit RGB) with 2 different mapping schemes, shown in Figure 13 and Figure 14. Each frame corresponds to a single pixel clock (PCLK) cycle. The LVDS clock input to CLK± follows a 4:3 duty cycle scheme, with each 28-bit pixel frame starting with two LVDS bit clock periods high, three low, and ending with two high. The mapping scheme is controlled by MAPSEL strap option or by Register (Table 10).

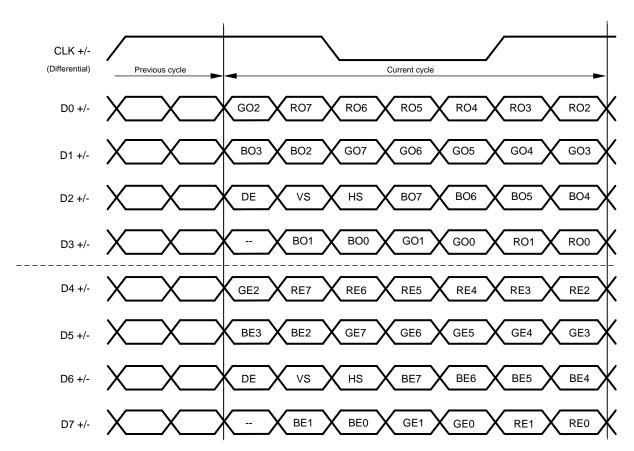

Figure 14. 24-Bit Color Dual Pixel Mapping: LSBs on D3/D7 (SPWG Mapping)

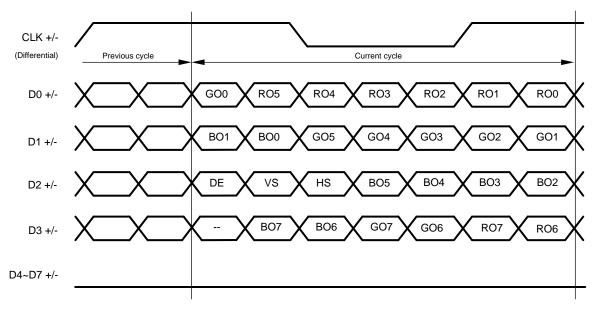

Figure 15. 24-Bit Color Single Pixel Mapping: MSBs on D3 (OpenLDI Mapping)

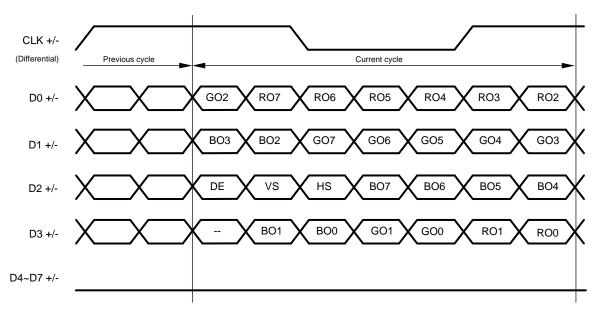

Figure 16. 24-Bit Color Single Pixel Mapping: LSBs on D3 (SPWG Mapping)

### 7.3.5 Video Control Signals

The video control signal bits embedded in the high-speed FPD-Link LVDS are subject to certain limitations relative to the video pixel clock period (PCLK). By default, the DS90UB947-Q1 applies a minimum pulse width filter on these signals to help eliminate spurious transitions.

Normal Mode Control Signals (VS, HS, DE) have the following restrictions:

- Horizontal Sync (HS): The video control signal pulse width must be 3 PCLKs or longer when the Control Signal Filter (register bit 0x03[4]) is enabled (default). Disabling the Control Signal Filter removes this restriction (minimum is 1 PCLK). See Table 10. HS can have at most two transitions per 130 PCLKs.
- Vertical Sync (VS): The video control signal pulse is limited to 1 transition per 130 PCLKs. Thus, the minimum pulse width is 130 PCLKs.
- Data Enable Input (DE): The video control signal pulse width must be 3 PCLKs or longer when the Control Signal Filter (register bit 0x03[4]) is enabled (default). Disabling the Control Signal Filter removes this restriction (minimum is 1 PCLK). See Table 10. DE can have at most two transitions per 130 PCLKs.

### 7.3.6 Power Down (PDB)

The Serializer has a PDB input pin to ENABLE or POWER DOWN the device. This pin may be controlled by an external device, or through  $V_{DDIO}$ , where  $V_{DDIO}=1.71~V$  to 1.89 V. To save power, disable the link when the display is not needed (PDB = LOW). Ensure that this pin is not driven HIGH before all power supplies have reached final levels. When PDB is driven low, ensure that the pin is driven to 0V for at least 3ms before releasing or driving high. In the case where PDB is pulled up to  $V_{DDIO}$  directly, a 10-k $\Omega$  pull-up resistor and a >10 $\mu$ F capacitor to ground are required (See *Power-Up Requirements and PDB Pin*).

Toggling PDB low will POWER DOWN the device and RESET all control registers to default. During this time, PDB must be held low for a minimum of 3ms before going high again.

### 7.3.7 Serial Link Fault Detect

The DS90UB947-Q1 can detect fault conditions in the FPD-Link III interconnect. If a fault condition occurs, the Link Detect Status is 0 (cable is not detected) on bit 0 of address 0x0C (Table 10). The DS90UB947-Q1 will detect any of the following conditions:

- 1. Cable open
- 2. "+" to "-" short

- 3. "+" to GND short
- 4. "-" to GND short
- 5. "+" to battery short
- 6. "-" to battery short
- 7. Cable is linked incorrectly (DOUT+/DOUT- connections reversed)

Note: The device will detect any of the above conditions, but does not report specifically which one has occurred.

### 7.3.8 Interrupt Pin (INTB)

The INTB pin is an active low interrupt output pin that acts as an interrupt for various local and remote interrupt conditions (see registers 0xC6 and 0xC7 of *Register Maps*). For the remote interrupt condition, the INTB pin works in conjunction with the INTB\_IN pin on the deserializer. This interrupt signal, when configured, will propagate from the deserializer to the serializer.

- 1. On the Serializer, set register 0xC6[5] = 1 and 0xC6[0] = 1
- 2. Deserializer INTB IN pin is set LOW by some downstream device.
- 3. Serializer pulls INTB pin LOW. The signal is active LOW, so a LOW indicates an interrupt condition.
- 4. External controller detects INTB = LOW; to determine interrupt source, read ISR register.
- 5. A read to ISR will clear the interrupt at the Serializer, releasing INTB.
- 6. The external controller typically must then access the remote device to determine downstream interrupt source and clear the interrupt driving the Deserializer INTB\_IN. This would be when the downstream device releases the INTB\_IN pin on the Deserializer. The system is now ready to return to step (2) at next falling edge of INTB\_IN.

## 7.3.9 Remote Interrupt Pin (REM\_INTB)

REM\_INTB will mirror the status of INTB\_IN pin on the deserializer and does not need to be cleared. If the serializer is not linked to the deserializer, REM\_INTB will be high.

## 7.3.10 General-Purpose I/O

# 7.3.10.1 GPIO[3:0] Configuration

In normal operation, GPIO[3:0] may be used as general-purpose IOs in either forward channel (outputs) or back channel (inputs) mode. GPIO modes may be configured from the registers. See Table 1 for GPIO enable and configuration.

**Table 1. GPIO Enable and Configuration** 

| DESCRIPTION | DEVICE       | FORWARD CHANNEL | BACK CHANNEL    |
|-------------|--------------|-----------------|-----------------|
| GPIO3       | Serializer   | 0x0F[3:0] = 0x3 | 0x0F[3:0] = 0x5 |
|             | Deserializer | 0x1F[3:0] = 0x5 | 0x1F[3:0] = 0x3 |
| GPIO2       | Serializer   | 0x0E[7:4] = 0x3 | 0x0E[7:4] = 0x5 |
|             | Deserializer | 0x1E[7:4] = 0x5 | 0x1E[7:4] = 0x3 |
| GPIO1       | Serializer   | 0x0E[3:0] = 0x3 | 0x0E[3:0] = 0x5 |
|             | Deserializer | 0x1E[3:0] = 0x5 | 0x1E[3:0] = 0x3 |
| GPIO0       | Serializer   | 0x0D[3:0] = 0x3 | 0x0D[3:0] = 0x5 |
|             | Deserializer | 0x1D[3:0] = 0x5 | 0x1D[3:0] = 0x3 |

## 7.3.10.2 Back Channel Configuration

The D\_GPIO[3:0] pins can be configured to obtain different sampling rates depending on the mode as well as back channel frequency. These different modes are controlled by a compatible deserializer. Consult the appropriate deserializer datasheet for details on how to configure the back channel frequency. See Table 2 for details about D\_GPIOs in various modes.

### Table 2. Back Channel D\_GPIO Effective Frequency

| HSCC_MODE | MODE   | NUMBER OF SAMPI |           | NUMBER OF SAMPLES D_GPIO Effective Frequency |                           | ffective Frequen          | cy <sup>(1)</sup> (kHz) | D_GPIOs |
|-----------|--------|-----------------|-----------|--|---------------------------|---------------------------|-------------------------|---------|
| (on DES)  | MODE   | D_GPIOs         | PER FRAMe | 5 Mbps BC <sup>(2)</sup>                     | 10 Mbps BC <sup>(3)</sup> | 20 Mbps BC <sup>(4)</sup> | ALLOWED                 |         |
| 000       | Normal | 4               | 1         | 33   | 66                        | 133                       | D_GPIO[3:0]             |         |
| 011       | Fast   | 4               | 6         | 200  | 400                       | 800                       | D_GPIO[3:0]             |         |
| 010       | Fast   | 2               | 10        | 333  | 666                       | 1333                      | D_GPIO[1:0]             |         |
| 001       | Fast   | 1               | 15        | 500  | 1000                      | 2000                      | D_GPIO0                 |         |

- (1) The effective frequency assumes the worst case back channel frequency (-20%) and a 4X sampling rate.
- (2) 5 Mbps corresponds to BC FREQ SELECT = 0 & BC\_HS\_CTL = 0 on deserializer.
- 3) 10 Mbps corresponds to BC FREQ SELECT = 1 & BC\_HS\_CTL = 0 on deserializer.
- (4) 20 Mbps corresponds to BC FREQ SELECT = X & BC\_HS\_CTL = 1 on deserializer.

# 7.3.10.3 GPIO\_REG[8:5] Configuration

GPIO\_REG[8:5] are register-only GPIOs and may be programmed as outputs or read as inputs through local register bits only. Where applicable, these bits are shared with I2S pins and will override I<sup>2</sup>S input if enabled into GPIO\_REG mode. See Table 3 for GPIO enable and configuration.

Note: Local GPIO value may be configured and read either through local register access, or remote register access through the Bidirectional Control Channel. Configuration and state of these pins are not transported from serializer to deserializer as is the case for GPIO[3:0].

Table 3. GPIO\_REG and GPIO Local Enable and Configuration

| DESCRIPTION | REGISTER CONFIGURATION | FUNCTION             |
|-------------|------------------------|----------------------|
| GPIO_REG8   | 0x11[7:4] = 0x01       | Output, L            |
|             | 0x11[7:4] = 0x09       | Output, H            |
|             | 0x11[7:4] = 0x03       | Input, Read: 0x1D[0] |
| GPIO_REG7   | 0x11[3:0] = 0x1        | Output, L            |
|             | 0x11[3:0] = 0x9        | Output, H            |
|             | 0x11[3:0] = 0x3        | Input, Read: 0x1C[7] |
| GPIO_REG6   | 0x10[7:4] = 0x1        | Output, L            |
|             | 0x10[7:4] = 0x9        | Output, H            |
|             | 0x10[7:4] = 0x3        | Input, Read: 0x1C[6] |
| GPIO_REG5   | 0x10[3:0] = 0x1        | Output, L            |
|             | 0x10[3:0] = 0x9        | Output, H            |
|             | 0x10[3:0] = 0x3        | Input, Read: 0x1C[5] |
| GPIO3       | 0x0F[3:0] = 0x1        | Output, L            |
|             | 0x0F[3:0] = 0x9        | Output, H            |
|             | 0x0F[3:0] = 0x3        | Input, Read: 0x1C[3] |
| GPIO2       | 0x0E[7:4] = 0x1        | Output, L            |
|             | 0x0E[7:4] = 0x9        | Output, H            |
|             | 0x0E[7:4] = 0x3        | Input, Read: 0x1C[2] |
| GPIO1       | 0x0E[3:0] = 0x1        | Output, L            |
|             | 0x0E[3:0] = 0x9        | Output, H            |
|             | 0x0E[3:0] = 0x3        | Input, Read: 0x1C[1] |
| GPIO0       | 0x0D[3:0] = 0x1        | Output, L            |
|             | 0x0D[3:0] = 0x9        | Output, H            |
|             | 0x0D[3:0] = 0x3        | Input, Read: 0x1C[0] |

### 7.3.11 SPI Communication

The SPI Control Channel utilizes the secondary link in a 2-lane FPD-Link III implementation. Two possible modes are available, Forward Channel and Reverse Channel modes. In Forward Channel mode, the SPI Master is located at the Serializer, such that the direction of sending SPI data is in the same direction as the video data. In Reverse Channel mode, the SPI Master is located at the Deserializer, such that the direction of sending SPI data is in the opposite direction as the video data.

The SPI Control Channel can operate in a high-speed mode when writing data, but must operate at lower frequencies when reading data. During SPI reads, data is clocked from the slave to the master on the SPI clock falling edge. Thus, the SPI read must operate with a clock period that is greater than the round trip data latency. On the other hand, for SPI writes, data can be sent at much higher frequencies where the MISO pin can be ignored by the master.

SPI data rates are not symmetrical for the two modes of operation. Data over the forward channel can be sent much faster than data over the reverse channel.

# NOTE SPI cannot be used to access Serializer / Deserializer registers.

# 7.3.11.1 SPI Mode Configuration

SPI is configured over I<sup>2</sup>C using the High-Speed Control Channel Configuration (HSCC\_CONTROL) register 0x43 on the deserializer. HSCC\_MODE (0x43[2:0]) must be configured for either High-Speed, Forward Channel SPI mode (110) or High-Speed, Reverse Channel SPI mode (111).

The High-Speed Control Channel should be enabled only after Rx lock has been established.

# 7.3.11.2 Forward Channel SPI Operation

In Forward Channel SPI operation, the SPI master located at the Serializer generates the SPI Clock (SPLK), Master Out / Slave In data (MOSI), and active low Slave Select (SS). The Serializer oversamples the SPI signals directly using the video pixel clock. The three sampled values for SPLK, MOSI, and SS are each sent on data bits in the forward channel frame. At the Deserializer, the SPI signals are regenerated using the pixel clock. In order to preserve setup and hold time, the Deserializer will hold MOSI data while the SPLK signal is high. In addition, it delays SPLK by one pixel clock relative to the MOSI data, increasing setup by one pixel clock.

### **SERIALIZER**

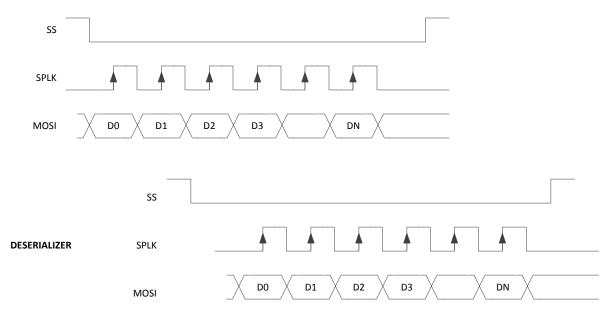

Figure 17. Forward Channel SPI Write

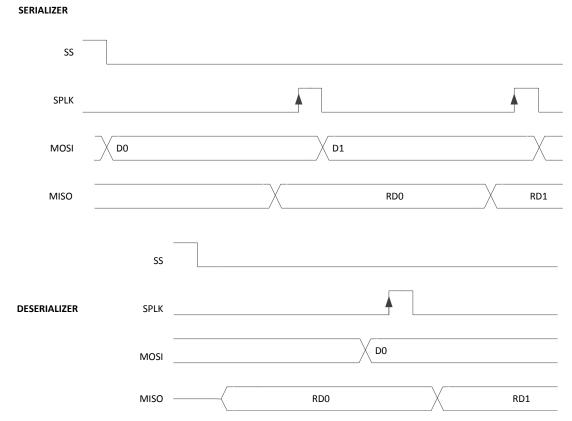

Figure 18. Forward Channel SPI Read

### 7.3.11.3 Reverse Channel SPI Operation

In Reverse Channel SPI operation, the Deserializer samples the Slave Select (SS), SPI clock (SCLK) into the internal oscillator clock domain. In addition, upon detection of the active SPI clock edge, the Deserializer samples the SPI data (MOSI). The SPI data samples are stored in a buffer to be passed to the Serializer over the back channel. The Deserializer sends SPI information in a back channel frame to the Serializer. In each back channel frame, the Deserializer sends an indication of the Slave Select value. The Slave Select should be inactive (high) for at least one back-channel frame period to ensure propagation to the Serializer.

Because data is delivered in separate back channel frames and buffered, the data may be regenerated in bursts. The following figure shows an example of the SPI data regeneration when the data arrives in three back channel frames. The first frame delivered the SS active indication, the second frame delivered the first three data bits, and the third frame delivers the additional data bits.

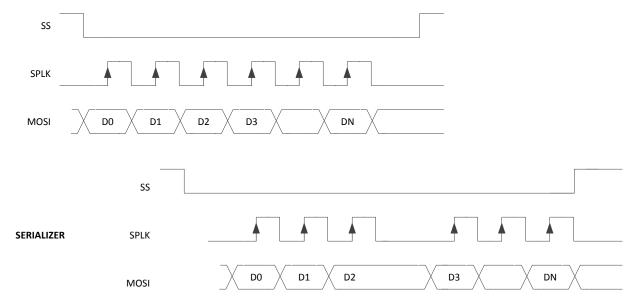

Figure 19. Reverse Channel SPI Write

For Reverse Channel SPI reads, the SPI master must wait for a round-trip response before generating the sampling edge of the SPI clock. This is similar to operation in Forward channel mode. Note that at most one data/clock sample will be sent per back channel frame.

### DESERIALIZER

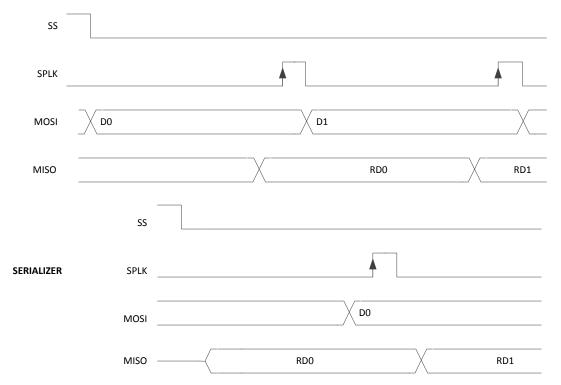

Figure 20. Reverse Channel SPI Read

For both Reverse Channel SPI writes and reads, the SPI\_SS signal should be deasserted for at least one back channel frame period.

| Table 4. SPI SS | Deassertion | Requirement |
|-----------------|-------------|-------------|
|-----------------|-------------|-------------|

| BACK CHANNEL FREQUENCY | DEASSERTION REQUIREMENT |  |
|------------------------|-------------------------|--|
| 5 Mbps                 | 7.5 µs                  |  |
| 10 Mbps                | 3.75 µs                 |  |
| 20 Mbps                | 1.875 µs                |  |

## 7.3.12 Backward Compatibility

This FPD-Link III serializer is backward compatible to the DS90UB926Q-Q1 and DS90UB928Q-Q1 for OpenLDI clock frequencies ranging from 25 MHz to 85 MHz. Backward compatibility does not need to be enabled. When paired with a backward compatible device, the serializer will auto-detect to 1-lane FPD-Link III on the primary channel (DOUT0±).

## 7.3.13 Audio Modes

## 7.3.13.1 I2S Audio Interface

The DS90UB947-Q1 serializer features six I<sup>2</sup>S input pins that, when paired with a compatible deserializer, supports 7.1 High-Definition (HD) Surround Sound audio applications. The bit clock (I2S\_CLK) supports frequencies between 1MHz and the lesser of CLK/2 or 13 MHz. Four I<sup>2</sup>S data inputs transport two channels of I<sup>2</sup>S-formatted digital audio each, with each channel delineated by the word select (I2S\_WC) input. Refer to Figure 21 and Figure 22 for I2S connection diagram and timing information.

Figure 21. I<sup>2</sup>S Connection Diagram

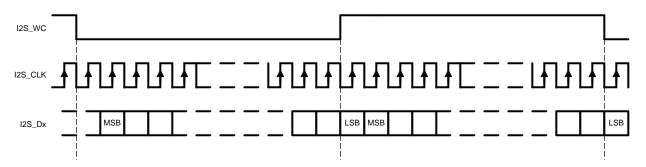

Figure 22. I2S Frame Timing Diagram

Table 5 covers several common I<sup>2</sup>S sample rates:

Table 5. Audio Interface Frequencies

| SAMPLE RATE (kHz) | I <sup>2</sup> S DATA WORD SIZE (bits) | I <sup>2</sup> S CLK (MHz) |
|-------------------|--|----------------------------|
| 32                | 16                                     | 1.024                      |
| 44.1              | 16                                     | 1.411                      |
| 48                | 16                                     | 1.536                      |
| 96                | 16                                     | 3.072                      |
| 192               | 16                                     | 6.144                      |
| 32                | 24                                     | 1.536                      |
| 44.1              | 24                                     | 2.117                      |

Table 5. Audio Interface Frequencies (continued)

| SAMPLE RATE (kHz) | I <sup>2</sup> S DATA WORD SIZE (bits) | I <sup>2</sup> S CLK (MHz) |
|-------------------|--|----------------------------|
| 48                | 24                                     | 2.304                      |
| 96                | 24                                     | 4.608                      |
| 192               | 24                                     | 9.216                      |
| 32                | 32                                     | 2.048                      |
| 44.1              | 32                                     | 2.822                      |
| 48                | 32                                     | 3.072                      |
| 96                | 32                                     | 6.144                      |
| 192               | 32                                     | 12.288                     |

### 7.3.13.1.1 I2S Transport Modes

By default, audio is packetized and transmitted during video blanking periods in dedicated Data Island Transport frames. Data Island frames may be disabled from control registers if Forward Channel Frame Transport of I<sup>2</sup>S data is desired. In this mode, only I2S\_DA is transmitted to a DS90UB928Q-Q1,DS90UB940-Q1, or DS90UB948-Q1 deserializer. If connected to a DS90UB926Q-Q1 deserializer, I2S\_DA and I2S\_DB are transmitted. Surround Sound Mode, which transmits all four I<sup>2</sup>S data inputs (I2S\_D[A..D]), may only be operated in Data Island Transport mode. This mode is only available when connected to a DS90UB928Q-Q1,DS90UB940-Q1, or DS90UB948-Q1 deserializer.

### 7.3.13.1.2 I2S Repeater

I<sup>2</sup>S audio may be fanned-out and propagated in the repeater application. By default, data is propagated via Data Island Transport during the video blanking periods. If frame transport is desired, then the I<sup>2</sup>S pins should be connected from the deserializer to all serializers. Activating surround sound at the top-level deserializer automatically configures downstream serializers and deserializers for surround sound transport utilizing Data Island Transport. If 4-channel operation utilizing I2S\_DA and I2S\_DB only is desired, this mode must be explicitly set in each serializer and deserializer control register throughout the repeater tree (Table 10).

### 7.3.13.2 TDM Audio Interface

In addition to the I2S audio interface, the DS90UB947-Q1 serializer also supports TDM format. Since a number of specifications for TDM format are in common use, the DS90UB947-Q1 offers flexible support for word length, bit clock, number of channels to be multiplexed, etc. For example, let's assume that word clock signal (I2S\_WC) period = 256 x bit clock (I2S\_CLK) time period. In this case, the DS90UB947-Q1 can multiplex 4 channels with maximum word length of 64 bits each, or 8 channels with maximum word length of 32 bits each. Figure 23 illustrates the multiplexing of 8 channels with 24 bit word length, in a format similar to I2S.

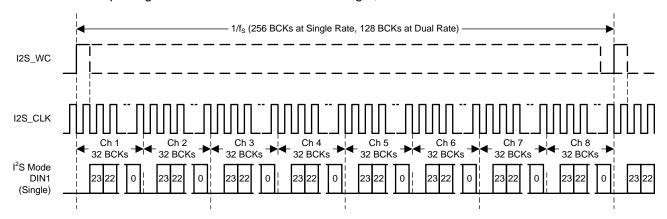

Figure 23. TDM Format

### 7.3.14 Repeater

The supported Repeater application provides a mechanism to extend transmission over multiple links to multiple display devices.

## 7.3.14.1 Repeater Configuration

In the repeater application, this document refers to the DS90UB947-Q1 Serializer or as the Transmitter (TX), and refers to the DS90UB948-Q1 as the Receiver (RX). Figure 24 shows the maximum configuration supported for Repeater implementations. Two levels of Repeaters are supported with a maximum of three Transmitters per Receiver.

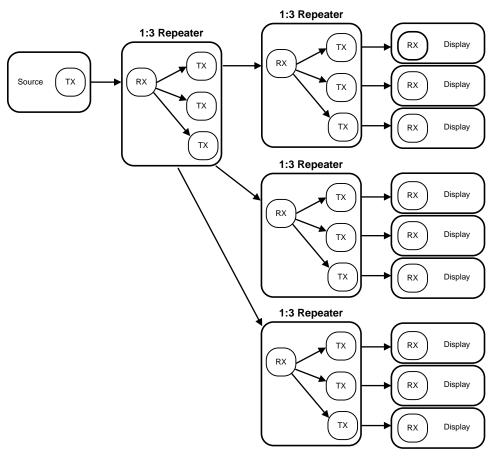

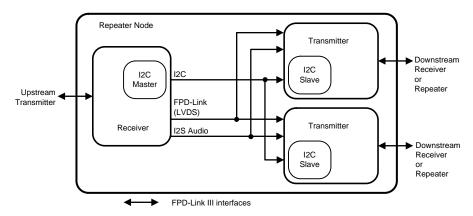

Figure 24. Maximum Repeater Application

In a repeater application, the <sup>12</sup>C interface at each TX and RX is configured to transparently pass I<sup>2</sup>C communications upstream or downstream to any I<sup>2</sup>C device within the system. This includes a mechanism for assigning alternate IDs (Slave Aliases) to downstream devices in the case of duplicate addresses.

Copyright © 2016, Texas Instruments Incorporated

Figure 25. 1:2 Repeater Configuration

## 7.3.14.2 Repeater Connections

The Repeater requires the following connections between the Receiver and each Transmitter Figure 26.

- 1. Video Data Connect all FPD-Link data and clock pairs. Single pixel OpenLDI (D[3:0]) or Dual pixel OpenLDI (D[7:0]) are both possible, provided the Deserializer and all Serializers are configured in the same mode.
- 2. I<sup>2</sup>C Connect SCL and SDA signals.
- 3. Audio (optional) Connect I2S\_CLK, I2S\_WC, and I2S\_Dx signals. Audio is normally transported on the OpenLDI interface.
- 4. IDx pin Each Transmitter and Receiver must have an unique I<sup>2</sup>C address.
- 5. MODE\_SEL pins All Transmitters and Receivers must be set into Repeater Mode. OpenLDI settings (single pixel vs. dual pixel) must also match.
- 6. Interrupt pin Connect DS90UB948-Q1 INTB\_IN pin to the DS90UB947-Q1 INTB pin. The signal must be pulled up to  $V_{DDIO}$  with a  $10k\Omega$  resistor.

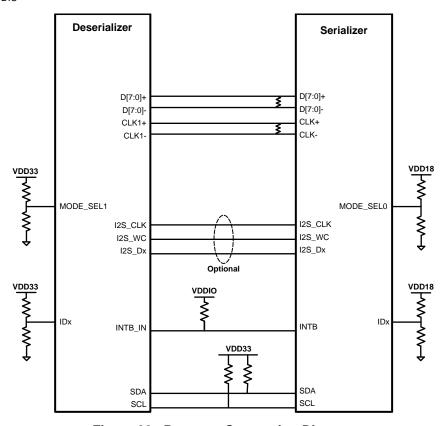

Figure 26. Repeater Connection Diagram

### 7.3.14.2.1 Repeater Fan-Out Electrical Requirements

Repeater applications requiring fan-out from one DS90UB948-Q1 Deserializer to up to three DS90UB947-Q1 Serializers requires special considerations for routing and termination of the FPD-Link differential traces. Figure 27 details the requirements that must be met for each signal pair:

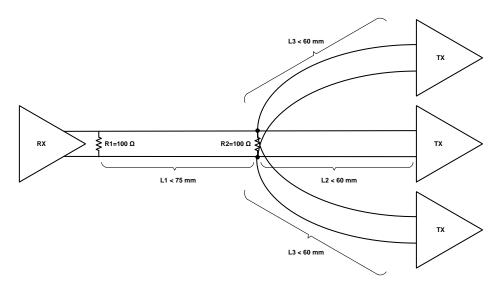

Figure 27. FPD-Link Fan-Out Electrical Requirements

### 7.3.15 Built-In Self Test (BIST)

An optional At-Speed Built-In Self Test (BIST) feature supports testing of the high-speed serial link and back channel without external data connections. This is useful in the prototype stage, equipment production, in-system test, and system diagnostics.

### 7.3.15.1 BIST Configuration and Status

The BIST mode is enabled at the descrializer by pin (BISTEN) or BIST configuration register. The test may select either an external OpenLDI clock or the internal Oscillator clock (OSC) frequency. In the absence of OpenLDI clock, the user can select the internal OSC frequency at the descrializer through the BISTC pin or BIST configuration register.

When BIST is activated at the deserializer, a BIST enable signal is sent to the serializer through the Back Channel. The serializer outputs a test pattern and drives the link at speed. The deserializer detects the test pattern and monitors it for errors. The deserializer PASS output pin toggles to flag each frame received containing one or more errors. The serializer also tracks errors indicated by the CRC fields in each back channel frame.

The BIST status can be monitored real time on the descrializer PASS pin, with each detected error resulting in a half pixel clock period toggled LOW. After BIST is deactivated, the result of the last test is held on the PASS output until reset (new BIST test or Power Down). A high on PASS indicates NO ERRORS were detected. A Low on PASS indicates one or more errors were detected. The duration of the test is controlled by the pulse width applied to the descrializer BISTEN pin. LOCK is valid throughout the entire duration of BIST.

See Figure 28 for the BIST mode flow diagram.

**Step 1:** The Serializer is paired with another FPD-Link III Deserializer, BIST Mode is enabled via the BISTEN pin or through register on the Deserializer. Right after BIST is enabled, part of the BIST sequence requires bit 0x04[5] be toggled locally on the Serializer (set 0x04[5]=1, then set 0x04[5]=0). The desired clock source is selected through the deserializer BISTC pin, or through register on the Deserializer.

**Step 2:** An all-zeros pattern is balanced, scrambled, randomized, and sent through the FPD-Link III interface to the deserializer. Once the serializer and the deserializer are in BIST mode and the deserializer acquires Lock, the PASS pin of the deserializer goes high and BIST starts checking the data stream. If an error in the payload (1 to 35) is detected, the PASS pin will switch low for one half of the clock period. During the BIST test, the PASS output can be monitored and counted to determine the payload error rate.

**Step 3:** To Stop the BIST mode, the deserializer BISTEN pin is set Low. The deserializer stops checking the data. The final test result is held on the PASS pin. If the test ran error free, the PASS output will remain HIGH. If there one or more errors were detected, the PASS output will output constant LOW. The PASS output state is held until a new BIST is run, the device is RESET, or the device is powered down. The BIST duration is user controlled by the duration of the BISTEN signal.

**Step 4:** The link returns to normal operation after the deserializer BISTEN pin is low. Figure 29 shows the waveform diagram of a typical BIST test for two cases. Case 1 is error free, and Case 2 shows one with multiple errors. In most cases it is difficult to generate errors due to the robustness of the link (differential data transmission etc.), thus they may be introduced by greatly extending the cable length, faulting the interconnect medium, or reducing signal condition enhancements (Rx Equalization).

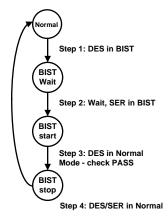

Figure 28. BIST Mode Flow Diagram

## 7.3.15.2 Forward Channel and Back Channel Error Checking

While in BIST mode, the serializer stops sampling the FPD-Link input pins and switches over to an internal all zeroes pattern. The internal all-zeroes pattern goes through scrambler, DC-balancing, etc. and is transmitted over the serial link to the deserializer. The deserializer, on locking to the serial stream, compares the recovered serial stream with all-zeroes and records any errors in status registers. Errors are also dynamically reported on the PASS pin of the deserializer.

The back-channel data is checked for CRC errors once the serializer locks onto the back-channel serial stream, as indicated by link detect status (register bit 0x0C[0] - Table 10). CRC errors are recorded in an 8-bit register in the deserializer. The register is cleared when the serializer enters BIST mode. As soon as the serializer enters BIST mode, the functional mode CRC register starts recording any back channel CRC errors. The BIST mode CRC error register is active in BIST mode only and keeps a record of the last BIST run until cleared or the serializer enters BIST mode again.

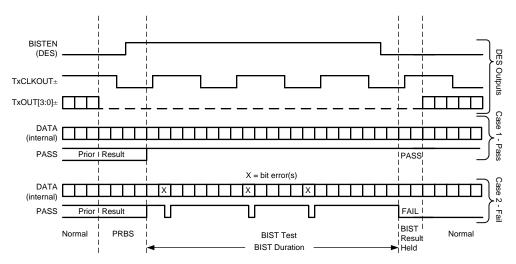

Figure 29. BIST Waveforms, in Conjunction With Deserializer Signals

### 7.3.16 Internal Pattern Generation

The DS90UB947-Q1 serializer provides an internal pattern generation feature. It allows basic testing and debugging of an integrated panel. The test patterns are simple and repetitive and allow for a quick visual verification of panel operation. As long as the device is not in power down mode, the test pattern will be displayed even if no input is applied. If no clock is received, the test pattern can be configured to use a programmed oscillator frequency. For detailed information, refer to AN-2198 Exploring Int Test Patt Gen Feat of 720p FPD-Link III Devices (SNLA132).

## 7.3.16.1 Pattern Options

The DS90UB947-Q1 serializer pattern generator is capable of generating 17 default patterns for use in basic testing and debugging of panels. Each can be inverted using register bits (Table 10), shown below:

- 1. White/Black (default/inverted)
- 2. Black/White
- 3. Red/Cyan
- 4. Green/Magenta
- 5. Blue/Yellow
- 6. Horizontally Scaled Black to White/White to Black
- 7. Horizontally Scaled Black to Red/Cyan to White
- 8. Horizontally Scaled Black to Green/Magenta to White
- 9. Horizontally Scaled Black to Blue/Yellow to White
- 10. Vertically Scaled Black to White/White to Black
- 11. Vertically Scaled Black to Red/Cyan to White
- 12. Vertically Scaled Black to Green/Magenta to White
- 13. Vertically Scaled Black to Blue/Yellow to White
- 14. Custom Color (or its inversion) configured in PGRS
- 15. Black-White/White-Black Checkerboard (or custom checkerboard color, configured in PGCTL)
- 16. YCBR/RBCY VCOM pattern, orientation is configurable from PGCTL
- 17. Color Bars (White, Yellow, Cyan, Green, Magenta, Red, Blue, Black) Note: not included in the autoscrolling feature

Additionally, the Pattern Generator incorporates one user-configurable full-screen 24-bit color, which is controlled by the PGRS, PGGS, and PGBS registers. This is pattern #14. One of the pattern options is statically selected in the PGCTL register when Auto-Scrolling is disabled. The PGTSC and PGTSO1-8 registers control the pattern selection and order when Auto-Scrolling is enabled.

### 7.3.16.2 Color Modes

By default, the Pattern Generator operates in 24-bit color mode, where all bits of the Red, Green, and Blue outputs are enabled. 18-bit color mode can be activated from the configuration registers (Table 10). In 18-bit mode, the 6 most significant bits (bits 7-2) of the Red, Green, and Blue outputs are enabled; the 2 least significant bits will be 0.

### 7.3.16.3 Video Timing Modes

The Pattern Generator has two video timing modes – external and internal. In external timing mode, the Pattern Generator detects the video frame timing present on the DE and VS inputs. If Vertical Sync signaling is not present on VS, the Pattern Generator determines Vertical Blank by detecting when the number of inactive pixel clocks (DE = 0) exceeds twice the detected active line length. In internal timing mode, the Pattern Generator uses custom video timing as configured in the control registers. The internal timing generation may also be driven by an external clock. By default, external timing mode is enabled. Internal timing or Internal timing with External Clock are enabled by the control registers (Table 10).

### 7.3.16.4 External Timing

In external timing mode, the Pattern Generator passes the incoming DE, HS, and VS signals unmodified to the video control outputs after a two pixel clock delay. It extracts the active frame dimensions from the incoming signals in order to properly scale the brightness patterns. If the incoming video stream does not use the VS signal, the Pattern Generator determines the Vertical Blank time by detecting a long period of pixel clocks without DE asserted.

#### 7.3.16.5 Pattern Inversion

The Pattern Generator also incorporates a global inversion control, located in the PGCFG register, which causes the output pattern to be bitwise-inverted. For example, the full screen Red pattern becomes full-screen cyan, and the Vertically Scaled Black to Green pattern becomes Vertically Scaled White to Magenta.

### 7.3.16.6 Auto Scrolling

The Pattern Generator supports an Auto-Scrolling mode, in which the output pattern cycles through a list of enabled pattern types. A sequence of up to 16 patterns may be defined in the registers. The patterns may appear in any order in the sequence and may also appear more than once.

### 7.3.16.7 Additional Features

Additional pattern generator features can be accessed through the Pattern Generator Indirect Register Map. It consists of the Pattern Generator Indirect Address (PGIA reg\_0x66 — Table 10) and the Pattern Generator Indirect Data (PGID reg\_0x67 — Table 10). See *AN-2198 Exploring Int Test Patt Gen Feat of 720p FPD-Link III Devices* (SNLA132).

### 7.4 Device Functional Modes

### 7.4.1 Mode Select Configuration Settings (MODE\_SEL[1:0])

Configuration of the device may be done via the MODE\_SEL[1:0] input pins, or via the configuration register bits. A pull-up resistor and a pull-down resistor of suggested values may be used to set the voltage ratio of the MODE\_SEL[1:0] inputs. See Table 7 and Table 8. These values will be latched into register location during power-up:

Table 6. MODE\_SEL[1:0] Settings

| MODE                         | SETTING | FUNCTION                        |  |
|------------------------------|---------|---------------------------------|--|
| OLDI_DUAL: OpenLDI Interface | 0       | Single-pixel OpenLDI interface. |  |
| OLDI_DOAL. OpenLDI Interface | 1       | Dual-pixel OpenLDI interface.   |  |
| REPEATER: Configure          | 0       | Disable repeater mode.          |  |
| Repeater                     | 1       | Enable repeater mode.           |  |
| MARCEL: Open DI Bit Monning  | 0       | OpenLDI bit mapping.            |  |
| MAPSEL: OpenLDI Bit Mapping  | 1       | SPWG bit mapping.               |  |

## **Device Functional Modes (continued)**

# Table 6. MODE\_SEL[1:0] Settings (continued)

| MODE             | SETTING | FUNCTION                                      |  |
|------------------|---------|---|--|
| COAY: Cable Type | 0       | Enable FPD-Link III for twisted pair cabling. |  |
| COAX: Cable Type | 1       | Enable FPD-Link III for coaxial cabling.      |  |

| 7 | 0.792                                       | 1.425                         | 30.9   | 118   | 1      | 1    |
| 8 | 1   | 1.8                           | Any value less than 100                          | OPEN  | 1      | 1    |

The strapped values can be viewed and/or modified in the following locations:

- OLDI\_DUAL: Latched into OLDI\_IN\_MODE (0x4F[6], inverted from strap value).
- REPEATER: Latched into TX\_RPTR (0xC2[5]).
- MAPSEL: Latched into OLDI\_MAPSEL (0x4F[7]).
- COAX : Latched into DUAL\_CTL1[7], COAX\_MODE (0x5B[7]).

# 7.4.2 FPD-Link III Modes of Operation

The FPD-Link III transmit logic supports several modes of operation, dependent on the downstream receiver as well as the video being delivered. The following modes are supported:

## 7.4.2.1 Single Link Operation

Single Link mode transmits the video over a single FPD-Link III to a single receiver. Single link mode supports frequencies up to 96MHz for 24-bit video when paired with the DS90UB940-Q1/DS90UB948-Q1. This mode is compatible with the DS90UB926Q-Q1/DS90UB928Q-Q1 when operating below 85MHz.

In Forced Single mode (set via DUAL\_CTL1 register), the secondary TX Phy and back channel are disabled.

## 7.4.2.2 Dual Link Operation

In Dual Link mode, the FPD-Link III TX splits a single video stream and sends alternating pixels on two downstream links. The receiver must be a DS90UB948-Q1 or DS90UB940-Q1, capable of receiving the dual-stream video. Dual link mode is capable of supporting an OpenLDI clock frequency of up to 170MHz, with each FPD-Link III TX port running at one-half the frequency. This allows support for full 1080p video. The secondary FPD-Link III link could be used for high-speed control.

Dual Link mode may be automatically configured when connected to a DS90UB948-Q1/DS90UB940-Q1, if the video meets minimum frequency requirements. Dual Link mode may also be forced using the DUAL\_CTL1 register.

### 7.4.2.3 Replicate Mode

In this mode, the FPD-Link III TX operates as a 1:2 Repeater. The same video (up to 85MHz, 24-bit color) is delivered to each receiver.

Replicate mode may be automatically configured when connected to two independent Deserializers.

### 7.4.2.4 Auto-Detection of FPD-Link III Modes

The DS90UB947-Q1 automatically detects the capabilities of downstream links and can resolve whether a single device, dual-capable device, or multiple single link devices are connected.

In addition to the downstream device capabilities, the DS90UB947-Q1 will be able to detect the OpenLDI pixel clock frequency to select the proper operating mode.

If the DS90UB947-Q1 detects two independent devices, it will operate in Replicate mode, sending the single channel video on both connections. If the device detects a device on the secondary link, but not the first, it can send the video only on the second link.

Auto-detection can be disabled to allow forced modes of operation using the Dual Link Control Register (DUAL\_CTL1).

# 7.5 Programming

### 7.5.1 Serial Control Bus

This serializer may also be configured by the use of a I2C compatible serial control bus. Multiple devices may share the serial control bus (up to 8 device addresses supported). The device address is set via a resistor divider (R1 and R2 — see Figure 31 below) connected to the IDx pin.

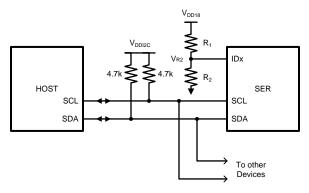

Figure 31. Serial Control Bus Connection

## Programming (continued)

The serial control bus consists of two signals, SCL and SDA. SCL is a Serial Bus Clock Input. SDA is the Serial Bus Data Input / Output signal. Both SCL and SDA signals require an external pull-up resistor to  $V_{DD18}$  or  $V_{DD33}$ . For most applications, a 4.7-k $\Omega$  pull-up resistor is recommended. However, the pull-up resistor value may be adjusted for capacitive loading and data rate requirements. The signals are either pulled High, or driven Low.

The IDx pin configures the control interface to one of 8 possible device addresses. A pull-up resistor and a pull-down resistor may be used to set the appropriate voltage on the IDx input pin See Table 10 below.

| # | RATIO<br>V <sub>R2</sub> / V <sub>DD18</sub> | IDEAL V <sub>R2</sub><br>(V) | SUGGESTED<br>RESISTOR R1 kΩ<br>(1% tol) | SUGGESTED<br>RESISTOR R2 kΩ<br>(1% tol) | 7-BIT ADDRESS | 8-BIT ADDRESS |
|---|--|------------------------------|---|---|---------------|---------------|
| 1 | 0  | 0                            | Any value less than 100                 | 40.2                                    | 0x0C          | 0x18          |
| 2 | 0.212  | 0.381                        | 133                                     | 35.7                                    | 0x0E          | 0x1C          |
| 3 | 0.327  | 0.589                        | 147                                     | 71.5                                    | 0x10          | 0x20          |
| 4 | 0.442  | 0.795                        | 115                                     | 90.9                                    | 0x12          | 0x24          |
| 5 | 0.557  | 1.002                        | 90.9                                    | 115                                     | 0x14          | 0x28          |
| 6 | 0.673  | 1.212                        | 66.5                                    | 137                                     | 0x16          | 0x2C          |
| 7 | 0.789  | 1.421                        | 21.5                                    | 80.6                                    | 0x18          | 0x30          |
| 8 | 1  | 1.8                          | Any value less than 100                 | OPEN                                    | 0x1A          | 0x34          |

Table 9. Serial Control Bus Addresses For IDx

The Serial Bus protocol is controlled by START, START-Repeated, and STOP phases. A START occurs when SCL transitions Low while SDA is High. A STOP occurs when SDA transitions High while SCL is also HIGH. See Figure 32

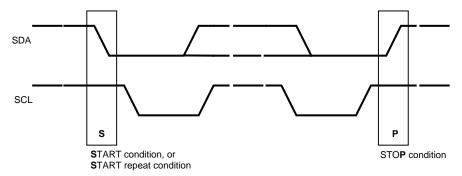

Figure 32. Start And Stop Conditions

To communicate with an I<sup>2</sup>C slave, the host controller (master) sends the slave address and listens for a response from the slave. This response is referred to as an acknowledge bit (ACK). If a slave on the bus is addressed correctly, it Acknowledges (ACKs) the master by driving the SDA bus low. If the address doesn't match a device's slave address, it Not-acknowledges (NACKs) the master by letting SDA be pulled High. ACKs also occur on the bus when data is being transmitted. When the master is writing data, the slave ACKs after every data byte is successfully received. When the master is reading data, the master ACKs after every data byte is received to let the slave know it wants to receive another data byte. When the master wants to stop reading, it NACKs after the last data byte and creates a stop condition on the bus. All communication on the bus begins with either a Start condition or a Repeated Start condition. All communication on the bus ends with a Stop condition. A READ is shown in Figure 25 and a WRITE is shown in Figure 26.

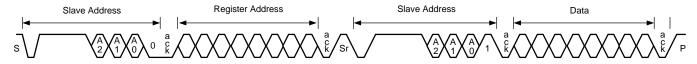

Figure 33. Serial Control Bus — Read

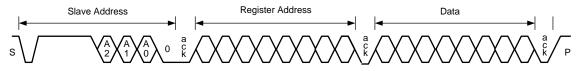

Figure 34. Serial Control Bus — Write

The I<sup>2</sup>C Master located at the serializer must support I<sub>2</sub>C clock stretching. For more information on I<sup>2</sup>C interface requirements and throughput considerations, refer to the *I2C Communication Over FPD-Link III with Bidirectional Control Channel* application note (SNLA131).

# 7.5.2 Multi-Master Arbitration Support

The Bidirectional Control Channel in the FPD-Link III devices implements  $I^2C$  compatible bus arbitration in the proxy  $I^2C$  master implementation. When sending a data bit, each  $I_2C$  master senses the value on the SDA line. If the master is sending a logic 1 but senses a logic 0, the master has lost arbitration. It will stop driving SDA, retrying the transaction when the bus becomes idle. Thus, multiple  $I^2C$  masters may be implemented in the system.

If the system does require master-slave operation in both directions across the BCC, some method of communication must be used to ensure only one direction of operation occurs at any time. The communication method could include using available read/write registers in the deserializer to allow masters to communicate with each other to pass control between the two masters. An example would be to use register 0x18 or 0x19 in the deserializer as a mailbox register to pass control of the channel from one master to another.

### 7.5.3 I2C Restrictions on Multi-Master Operation

The I<sup>2</sup>C specification does not provide for arbitration between masters under certain conditions. The system should make sure the following conditions cannot occur to prevent undefined conditions on the I<sup>2</sup>C bus:

- One master generates a repeated Start while another master is sending a data bit.
- One master generates a Stop while another master is sending a data bit.
- One master generates a repeated Start while another master sends a Stop.

Note that these restrictions mainly apply to accessing the same register offsets within a specific I2C slave.

### 7.5.4 Multi-Master Access to Device Registers for Newer FPD-Link III Devices

When using the latest generation of FPD-Link III devices, DS90UB947-Q1 or DS90UB940-Q1/DS90UB948-Q1 registers may be accessed simultaneously from both local and remote I<sup>2</sup>C masters. These devices have internal logic to properly arbitrate between sources to allow proper read and write access without risk of corruption.

Access to remote I<sup>2</sup>C slaves would still be allowed in only one direction at a time.

### 7.5.5 Multi-Master Access to Device Registers for Older FPD-Link III Devices

When using older FPD-Link III devices, simultaneous access to serializer or deserializer registers from both local and remote I<sup>2</sup>C masters may cause incorrect operation, thus restrictions should be imposed on accessing of serializer and deserializer registers. The likelihood of an error occurrence is relatively small, but it is possible for collision on reads and writes to occur, resulting in an errored read or write.

Two basic options are recommended. The first is to allow device register access only from one controller. This would allow only the Host controller to access the serializer registers (local) and the deserializer registers (remote). A controller at the deserializer would not be allowed to access the deserializer or serializer registers.

The second basic option is to allow local register access only with no access to remote serializer or deserializer registers. The Host controller would be allowed to access the serializer registers while a controller at the deserializer could access those register only. Access to remote I<sup>2</sup>C slaves would still be allowed in one direction .

In a very limited case, remote and local access could be allowed to the deserializer registers at the same time. Register access is guaranteed to work correctly if both local and remote masters are accessing the same deserializer register. This allows a simple method of passing control of the Bidirectional Control Channel from one master to another.

#### 7.5.6 Restrictions on Control Channel Direction for Multi-Master Operation

Only one direction should be active at any time across the Bidirectional Control Channel. If both directions are required, some method of transferring control between  $I^2C$  masters should be implemented.

## 7.6 Register Maps

Table 10. Serial Control Bus Registers

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME | BIT(S) | REGISTER<br>TYPE | DEFAULT<br>(hex) | FUNCTION                 | DESCRIPTION   |
|--------------|--------------|---------------|--------|------------------|------------------|--------------------------|---|
| 0            | 0 0x00       | I2C Device ID | 7:1    | RW               | IDx              | Device ID<br>Port0/Port1 | 7-bit address of Serializer. Defaults to address configured by the IDx strap pin. If PORT1_I2C_EN is set, this value defaults to the IDx strap value + 1 for Port1. If PORT1_SEL is set, this field refers to Port1 operation.  |
|              |              |               | 0      | RW               |                  | ID Setting               | I2C ID setting. 0: Device I2C address is from IDx pin (default). 1: Device I2C address is from 0x00[7:1].   |
| 1            | 0x01         | Reset         | 7:2    |                  | 0x00             |                          | Reserved.   |
|              |              |               | 1      | RW               |                  | Digital RESET1           | Reset the entire digital block including registers. This bit is self-clearing.  0: Normal operation (default).  1: Reset.   |
|              |              |               | 0      | RW               |                  | Digital RESET0           | Reset the entire digital block except registers. This bit is self-clearing. 0: Normal operation (default). 1: Reset. Registers which are loaded by pin strap will be restored to their original strap value when this bit is set. These registers show 'Strap' as their default value in this table. Registers 0x18, 0x19, 0x1A, and 0x48-0x55 are also restored to their default value when this bit is set. |

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME         | BIT(S) | REGISTER<br>TYPE | DEFAULT (hex) | FUNCTION   | DESCRIPTION   |
|--------------|--------------|-----------------------|--------|------------------|---------------|--|---|
| 3            | 0x03         | General Configuration | 7      | RW               | 0xD2          | Back channel<br>CRC Checker<br>Enable                  | Enable/disable back channel CRC Checker. 0: Disable. 1: Enable (default).   |
|              |              |                       | 6      |                  |               |  | Reserved.   |
|              |              |                       | 5      | RW               |               | I2C Remote<br>Write Auto<br>Acknowledge<br>Port0/Port1 | Automatically acknowledge I2C remote writes. When enabled, I2C writes to the Deserializer (or any remote I2C Slave, if I2C PASS ALL is enabled) are immediately acknowledged without waiting for the Deserializer to acknowledge the write. This allows higher throughput on the I2C bus. Note: this mode will prevent any NACK from a remote device from reaching the I2C master.  0: Disable (default).  1: Enable.  If PORT1_SEL is set, this field refers to Port1 operation. |
|              |              |                       | 4      | RW               |               | Filter Enable  | HS, VS, DE two-clock filter. When enabled, pulses less than two full PCLK cycles on the DE, HS, and VS inputs will be rejected.  0: Filtering disable.  1: Filtering enable (default).  |
|              |              |                       | 3      | RW               |               | I2C Pass-<br>through<br>Port0/Port1                    | I2C pass-through mode. Read/Write transactions matching any entry in the Slave Alias registers will be passed through to the remote Deserializer.  0: Pass-through disabled (default).  1: Pass-through enabled.  If PORT1_SEL is set, this field refers to Port1 operation.  |
|              |              |                       | 2      |                  |               |  | Reserved.   |
|              |              |                       | 1      | RW               |               | PCLK Auto  | Switch over to internal oscillator in the absence of PCLK. 0: Disable auto-switch. 1: Enable auto-switch (default).   |
|              |              |                       | 0      |                  |               |  | Reserved.   |
| 4            | 0x04         | Mode Select           | 7      | RW               | 0x80          | Failsafe State   | Input failsafe state. 0: Failsafe to High. 1: Failsafe to Low (default).  |
|              |              |                       | 6      |                  |               |  | Reserved.   |
|              |              |                       | 5      | RW               |               | CRC Error Reset  | Clear back channel CRC Error counters. This bit is NOT self-clearing. 0: Normal operation (default). 1: Clear counters.   |
|              |              |                       | 4      | RW               |               | DE_GATE_RGB  | Gate RGB data with DE signal. When this bit is set, the DS90UB947-Q1 will use the DE signal to gate the RGB video data. This bit should be set to a 1 for proper operation with most DS90Ux94x and DS90Ux92x deserializers.  1: Gate RGB data with DE.  0: Pass RGB data independent of DE.   |
|              |              |                       | 3:0    |                  |               |  | Reserved.   |

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME | BIT(S) | REGISTER<br>TYPE | DEFAULT (hex) | FUNCTION                           | DESCRIPTION   |
|--------------|--------------|---------------|--------|------------------|---------------|------------------------------------|---|
| 5            | 0x05         | I2C Control   | 7:5    |                  | 0x00          |                                    | Reserved.   |
|              |              |               | 4:3    | RW               |               | SDA Output<br>Delay                | Configures output delay on the SDA output. Setting this value will increase output delay in units of 40ns.  Nominal output delay values for SCL to SDA are: 00: 240ns (default). 01: 280ns. 10: 320ns. 11: 360ns.   |
|              |              |               | 2      | RW               |               | Local Write<br>Disable             | Disable remote writes to local registers. Setting this bit to 1 will prevent remote writes to local device registers from across the control channel. This prevents writes to the Serializer registers from an I2C master attached to the Deserializer. Setting this bit does not affect remote access to I2C slaves at the Serializer.  0: Enable (default).  1: Disable.  |
|              |              |               | 1      | RW               |               | I2C Bus Timer<br>Speedup           | Speed up I2C bus Watchdog Timer. 0: Watchdog Timer expires after approximately 1s (default). 1: Watchdog Timer expires after approximately 50µs.  |
|              |              |               | 0      | RW               |               | I2C Bus Timer<br>Disable           | Disable I2C bus Watchdog Timer. The I2C Watchdog Timer may be used to detect when the I2C bus is free or hung up following an invalid termination of a transaction. If SDA is high and no signaling occurs for approximately 1s, the I2C bus will be assumed to be free. If SDA is low and no signaling occurs, the device will attempt to clear the bus by driving 9 clocks on SCL.  0: Enable (default).  1: Disable.                         |
| 6            | 6 0x06       | DES ID        | 7:1    | RW               | 0x00          | DES Device ID<br>Port0/Port1       | 7-bit I2C address of the remote Deserializer. A value of 0 in this field disables I2C access to the remote Deserializer. This field is automatically configured by the Bidirectional Control Channel once RX Lock has been detected. Software may overwrite this value, but should also assert the FREEZE DEVICE ID bit to prevent overwriting by the Bidirectional Control Channel. If PORT1_SEL is set, this field refers to Port1 operation. |
|              |              |               | 0      | RW               |               | Freeze Device<br>ID<br>Port0/Port1 | Freeze Deserializer Device ID.  1: Prevents auto-loading of the Deserializer Device ID by the Bidirectional Control Channel. The ID will be frozen at the value written.  0: Allows auto-loading of the Deserializer Device ID from the Bidirectional Control Channel.  If PORT1_SEL is set, this field refers to Port1 operation.  |

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME  | BIT(S) | REGISTER<br>TYPE | DEFAULT (hex)            | FUNCTION   | DESCRIPTION  |
|--------------|--------------|----------------|--------|------------------|--------------------------|--|--|
| 7            | 0x07         | Slave ID[0]    | 7:1    | RW               | 0x00                     | Slave ID 0<br>Port0/Port1  | 7-bit I2C address of the remote Slave 0 attached to the remote Deserializer. If an I2C transaction is addressed to Slave Alias ID 0, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. A value of 0 in this field disables access to the remote Slave 0.  If PORT1_SEL is set, this field refers to Port1 operation. |
|              |              |                | 0      |                  |                          |  | Reserved.  |
| 8            | 0x08         | Slave Alias[0] | 7:1    | RW               | 0x00                     | Slave Alias ID 0<br>Port0/Port1  | 7-bit Slave Alias ID of the remote Slave 0 attached to the remote Deserializer. The transaction will be remapped to the address specified in the Slave ID 0 register. A value of 0 in this field disables access to the remote Slave 0.  If PORT1_SEL is set, this field refers to Port1 operation.  |
|              |              |                | 0      |                  |                          |  | Reserved.  |
| 10           | 0x0A         | CRC Errors     | 7:0    | R                | 0x00                     | CRC Error LSB<br>Port0/Port1   | Number of back channel CRC errors – 8 least significant bits. Cleared by 0x04[5].  If PORT1_SEL is set, this field refers to Port1 operation.  |
| 11           | 0x0B         |                | 7:0    | R                | 0x00                     | CRC Error MSB<br>Port0/Port1   | Number of back channel CRC errors – 8 most significant bits. Cleared by 0x04[5].  If PORT1_SEL is set, this field refers to Port1 operation.   |
| 12           | 0x0C         | General Status | 7:4    |                  | 0x00                     |  | Reserved.  |
|              |              |                | 3      | R                |                          | BIST CRC Error<br>Port0/Port1  | Back channel CRC error(s) during BIST communication with Deserializer. This bit is cleared upon loss of link, restart of BIST, or assertion of CRC Error Reset bit in 0x04[5].  0: No CRC errors detected during BIST.  1: CRC error(s) detected during BIST.  If PORT1_SEL is set, this field refers to Port1 operation.  |
|              |              |                | 2      | R                |                          | PCLK Detect  | Pixel clock status: 0: Valid PCLK not detected at OpenLDI input. 1: Valid PCLK detected at OpenLDI input. When the OpenLDI input is suddenly removed, this bit will remain asserted until and invalid (out of range) clock is applied.   |
|              |              | 1              | R      |                  | DES Error<br>Port0/Port1 | CRC error(s) during normal communication with Deserializer. This bit is cleared upon loss of link or assertion of 0x04[5]. 0: No CRC errors detected. 1: CRC error(s) detected. If PORT1_SEL is set, this field refers to Port1 operation. |  |
|              |              |                | 0      | R                |                          | LINK Detect<br>Port0/Port1   | LINK detect status: 0: Cable link not detected. 1: Cable link detected. If PORT1_SEL is set, this field refers to Port1 operation.   |

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME                              | BIT(S) | REGISTER<br>TYPE | DEFAULT<br>(hex)      | FUNCTION  | DESCRIPTION   |

OSC Clock Frequency in Functional Mode when PCLK is not present and 0x03[2]=1.  00: 50MHz Oscillator. 01: 50 MHz Oscillator. 10: 100 MHz Oscillator. 11: 25 MHz Oscillator. Clock Source in BIST mode i.e. when 0x14[0]=1. 00: External Pixel Clock. 01: 50 MHz Oscillator. 10: 100 MHz Oscillator. 11: 25 MHz Oscillator. |   |
|              |              |                         | 0      | R                |                     | BIST Enable  | BIST control: 0: Disabled (default). 1: Enabled.  |
| 21           | 0x15         | I2C Voltage Select      | 7:0    | RW               | 0x01                | I2C Voltage<br>Select  | Selects 1.8 or 3.3V for the I2C_SDA and I2C_SCL pins. This register is loaded from the I2C_VSEL strap option from the I2CSEL pin at power-up. At power-up, a logic LOW will select 3.3V operation, while a logic HIGH (pull-up resistor attached) will select 1.8V signaling. Issuing either of the digital resets via register 0x01 will cause the I2C_VSEL value to be reset to 3.3V operation. Reads of this register return the status of the I2C_VSEL control: 0: Select 1.8V signaling.  1: Select 3.3V signaling.  This bit may be overwritten via register access or via eFuse program by writing an 8-bit value to this register: Write 0xb5 to set I2C_VSEL.  Write 0xb6 to clear I2C_VSEL. |
| 22           | 0x16         | BCC Watchdog<br>Control | 7:1    | RW               | 0xFE                | Timer Value  | The watchdog timer allows termination of a control channel transaction if it fails to complete within a programmed amount of time. This field sets the Bidirectional Control Channel Watchdog Timeout value in units of 2 milliseconds. This field should not be set to 0.  |
|              |              |                         | 0      | RW               |                     | Timer Control  | Disable Bidirectional Control Channel (BCC) Watchdog Timer: 0: Enable BCC Watchdog Timer operation (default). 1: Disable BCC Watchdog Timer operation.  |

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME       | BIT(S) | REGISTER<br>TYPE | DEFAULT (hex) | FUNCTION         | DESCRIPTION   |

|--------------|--------------|-------------------|--------|------------------|---------------|-----------------|--|
| 30           | 0x1E         | Port Select       | 7:3    |                  | 0x01          |                 | Reserved.  |
|              |              |                   | 2      | RW               |               | PORT1_I2C_EN    | Port1 I2C Enable: Enables secondary I2C address. The second I2C address provides access to port1 registers as well as registers that are shared between ports 0 and 1. The second I2C address value will be set to DeviceID + 1 (7-bit format). The PORT1_I2C_EN bit must also be set to allow accessing remote devices over the second link when the device is in Replicate mode.   |
|              |              |                   | 1      | RW               |               | PORT1_SEL       | Selects Port 1 for Register Access from primary I2C Address. For writes, Port 1 registers and shared registers will both be written. For reads, Port 1 registers and shared registers will be read. This bit must be cleared to read Port 0 registers.  If this bit is set, GPIO[3:0] registers control operation for D_GPIO[3:0] registers.  This bit is ignored if PORT1_I2C_EN is set.  |
|              |              |                   | 0      | RW               |               | PORTO_SEL       | Selects Port 0 for Register Access from primary I2C Address. For writes, Port 0 registers and shared registers will both be written. For reads, Port 0 registers and shared registers will be read. Note that if PORT1_SEL is also set, then Port 1 registers will be read. This bit is ignored if PORT1_I2C_EN is set.  |
| 31           | 0x1F         | Frequency Counter | 7:0    | RW               | 0x00          | Frequency Count | Frequency Counter control: A write to this register will enable a frequency counter to count the number of pixel clock during a specified time interval. The time interval is equal to the value written multiplied by the oscillator clock period (nominally 40ns). A read of the register returns the number of pixel clock edges seen during the enabled interval. The frequency counter will freeze at 0xff if it reaches the maximum value. The frequency counter will provide a rough estimate of the pixel clock period. If the pixel clock frequency is known, the frequency counter may be used to determine the actual oscillator clock frequency. |

TDM audio data on the I2S_DA pin will be split onto four I2S data signals.  |
|              |              |               | 6:0    |                  |               |                    | Reserved.  |
| 87           | 0x57         | TDM_CONFIG    | 7:4    |                  |               |                    | Reserved.  |
|              |              | TEM_GONITO    | 3      | RW               | 0x00          | TDM_FS_MODE        | TDM Frame Sync Mode: Sets active level for the Frame Sync for the TDM audio. The Frame Sync signal provides an active pulse to indicate the first sample data on the TDM data signal.  0: Active high Frame Sync.  1: Active low Frame Sync (similar to I2S word select).  This bit is used for both the output of the I2S to TDM conversion and the input of the TDM to I2S conversion. |
|              |              |               | 2      | RW               | 0x00          | TDM_DELAY          | TDM Data Delay: Controls data delay for TDM audio samples from the active Frame Sync edge.  0: Data is not delayed from Frame Sync (data is left justified).  1: Data is delayed 1 bit from Frame Sync.  This bit is used for both the output of the I2S to TDM conversion and the input of the TDM to I2S conversion.   |
|              |              |               | 1:0    | RW               | 0x02          | TDM_FS_WIDT<br>H   | TDM Frame Sync Width: Indicates width of TDM Frame Sync pulse for I2S to TDM conversion.  00: FS is 50/50 duty cycle.  01: FS is one slot/channel wide.  1x: FS is 1 clock pulse wide.   |

|--------------|-------------------|---------------|--------|------------------|---|---|--|
| 91           | 91 Ox5B DUAL_CTL1 | DUAL_CTL1     | 7      | RW               | Strap   | FPD3_COAX_M<br>ODE  | FPD-Link III Coax Mode: Enables configuration for the FPD-Link III Interface cabling type: 0 : Twisted Pair. 1 : Coax. This bit is loaded from the MODE_SEL1 pin at power-up.  |
|              |                   |               | 6      | RW               | 0x20  | DUAL_SWAP   | Dual Swap Control:<br>Indicates current status of the Dual Swap control. If automatic<br>correction of Dual Swap is disabled via the DISABLE_DUAL_SWAP<br>control, this bit may be modified by software.   |
|              |                   |               | 5      | RW               |   | RST_PLL_FREQ  | Reset FPD-Link III PLL on Frequency Change: When set to a 1, frequency changes detected by the Frequency Detect circuit will result in a reset of the FPD3 PLL.  |
|              |                   | 4             | RW     |                  | FREQ_DET_PLL  | Frequency Detect Select PLL Clock. Determines the clock source for the Frequency detection circuit:  0 : OpenLDI clock (prior to PLL).  1: OpenLDI PLL clock. |  |
|              |                   |               | 3      | RW               |   | DUAL_ALIGN_D<br>E   | Dual Align on DE: In dual-link mode, if this bit is set to a 1, the odd/even data will be sent on the primary/secondary links respectively, based on the assertion of DE. If this bit is set to a 0, data will be sent on alternating links without regard to odd/even pixel position.                                 |
|              |                   | 1 RW  0 RW    | 2      | RW               |   | DISABLE_DUAL  | Disable Dual Mode: During Auto-detect operation, setting this bit to a 1 will disable Dual FPD-Link III operation. 0: Normal Auto-detect operation. 1: Only Single or Replicate operation supported. This bit will have no effect if FORCE_LINK is set.  |
|              |                   |               |        | FORCE_DUAL       | Force dual mode: When FORCE_LINK bit is set, the value on this bit controls single versus dual operation: 0: Single FPD-Link III Transmitter mode. 1: Dual FPD-Link III Transmitter mode. |   |  |
|              |                   |               | 0      | RW               |   | FORCE_LINK  | Force Link Mode: Forces link to dual or single mode, based on the FORCE_DUAL control setting. If this bit is 0, mode setting will be automatically set based on downstream device capabilities as well as the incoming data frequency.  1: Forced Single or Dual FPD-Link III mode.  0: Auto-Detect FPD-Link III mode. |

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME     | BIT(S) | REGISTER<br>TYPE | DEFAULT (hex)     | FUNCTION  | DESCRIPTION   |
|--------------|--------------|-------------------|--------|------------------|-------------------|---|---|
| 92           | 0x5C         | DUAL_CTL2         | 7      | RW               | 0x00              | DISABLE_DUAL<br>_SWAP   | Disable Dual Swap: Prevents automatic correction of swapped Dual link connection. Setting this bit allows writes to the DUAL_SWAP control in the DUAL_CTL1 register.  |
|              |              |                   | 6      | RW               |                   | FORCE_LINK_R<br>DY  | Force Link Ready. Forces link ready indication, bypassing back channel link detection.  |
|              |              | 5                 | RW     |                  | FORCE_CLK_D<br>ET | Force Clock Detect. Forces the OpenLDI clock detect circuit to indicate presence of a valid input clock. This bypasses the clock detect circuit, allowing operation with an input clock that does not meet frequency or stability requirements. |   |
|              |              |                   | 4:3    | RW               |                   | FREQ_STBL_T<br>HR   | Frequency Stability Threshold: The Frequency detect circuit can be used to detect a stable clock frequency. The Stability Threshold determines the amount of time required for the clock frequency to stay within the FREQ_HYST range to be considered stable:  00: 160us.  01: 640us.  10: 1.28ms.  11: 2.55ms.  |
|              |              |                   | 2:0    | RW               | 0x02              | FREQ_HYST   | Frequency Detect Hysteresis: The Frequency detect hysteresis setting allows ignoring minor fluctuations in frequency. A new frequency measurement will be captured only if the measured frequency differs from the current measured frequency by more than the FREQ_HYST setting. The FREQ_HYST setting is in MHz.  |
| 93           | 0x5D         | FREQ_LOW          | 7      |                  |                   |   | Reserved.   |
|              |              |                   | 6      | RW               | 0x00              | OLDI_RST_MO<br>DE   | OLDI Phy Reset Mode: 0 : Reset OLDI Phy on change in mode or frequency. 1 : Don't reset OLDI Phy on change in mode or frequency.  |
|              |              |                   | 5:0    | RW               | 0x06              | FREQ_LO_THR   | Frequency Low Threshold: Sets the low threshold for the OLDI Clock frequency detect circuit in MHz. This value is used to determine if the OLDI clock frequency is too low for proper operation.  |
| 94           | 0x5E         | FREQ_HIGH         | 7      |                  |                   |   | Reserved.   |
|              |              |                   | 6:0    | RW               | 44                | FREQ_HI_THR   | Frequency High Threshold: Sets the high threshold for the OLDI Clock frequency detect circuit in MHz.   |
| 95           | 0x5F         | OpenLDI Frequency | 7:0    | R                | 0x00              | OLDI_FREQ   | OLDI Pixel Frequency: Returns the value of the OLDI pixel Frequency of the video data. This register indicates the pixel rate for the incoming data. If the OLDI interface is in single-pixel mode, the pixel frequency is the same as the OLDI frequency. If the OLDI interface is in dual-pixel mode, the pixel frequency is 2x the OLDI frequency. A value of 0 indicates the OLDI receiver is not detecting a valid signal.  When the OpenLDI input is suddenly removed, this register will retain its value. |

| ADD<br>(dec) | ADD<br>(hex) | REGISTER NAME | BIT(S) | REGISTER<br>TYPE | DEFAULT (hex) | FUNCTION          | DESCRIPTION   |   |
|--------------|--------------|---------------|--------|------------------|---------------|-------------------|---|---|
| 96           | 96 0x60      | SPI_TIMING1   | 7:4    | RW               | 0x02          | SPI_HOLD          | SPI Data Hold from SPI clock: These bits set the minimum hold time for SPI data following the SPI clock sampling edge. In addition, this also sets the minimum active pulse width for the SPI output clock. Hold = (SPI_HOLD + 1) * 40ns. For example, default setting of 2 will result in 120ns data hold time.  |   |
|              |              |               | 3:0    | RW               | 0x02          | SPI_SETUP         | SPI Data Setup to SPI Clock: These bits set the minimum setup time for SPI data to the SPI clock active edge. In addition, this also sets the minimum inactive width for the SPI output clock.  Setup = (SPI_SETUP + 1) * 40ns.  For example, default setting of 2 will result in 120ns data setup time.  |   |
| 97           | 0x61         | SPI_TIMING2   | 7:4    |                  |               |                   | Reserved.   |   |
|              |              |               | 3:0    | RW               | 0x00          | SPI_SS_SETUP      | SPI Slave Select Setup: This field controls the delay from assertion of the Slave Select low to initial data timing. Delays are in units of 40ns. Delay = (SPI_SS_SETUP + 1) * 40ns.  |   |
| 98           | 0x62         | SPI_CONFIG    | 7      | R                | 0x00          | SPI_MSTR_OVE<br>R | SPI Master Overflow Detection: This flag is set if the SPI Master detects an overflow condition. This occurs if the SPI Master is unable to regenerate the remote SPI data at a fast enough rate to keep up with data arriving from the remote Deserializer. If this condition occurs, it suggests the SPI_SETUP and SPI_HOLD times should be set to smaller values. This flag is cleared by setting the SPI_CLR_OVER bit in this register. |   |
|              |              |               | 6:3    |                  |               |                   | Reserved.   |   |
|              |              |               |        | 2                | RW            | 0x00              | SPI_CLR_OVER  | Clear SPI Master Overflow Flag: Setting this bit to 1 will clear the SPI Master Overflow Detection flag (SPI_MSTR_OVER). This bit is not self-clearing and must be set back to 0. |
|              |              |               | 1      | R                | 0x00          | SPI_CPHA          | SPI Clock Phase setting: Determines which phase of the SPI clock is used for sampling data.  0: Data sampled on leading (first) clock edge.  1: Data sampled on trailing (second) clock edge.  This bit is read-only, with a value of 0. The DS90UB947-Q1 does not support CPHA of 1.   |   |
|              |              |               | 0      | RW               | 0x00          | SPI_CPOL          | SPI Clock Polarity setting: Determines the base (inactive) value of the SPI clock. 0: base value of the clock is 0. 1: base value of the clock is 1. This bit affects both capture and propagation of SPI signals.  |   |

#### 8 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

#### 8.1 Applications Information

The DS90UB947-Q1, in conjunction with the DS90UB940-Q1/DS90UB948-Q1 deserializer, is intended to interface between a host (graphics processor) and a display, supporting 24-bit color depth (RGB888) and high definition (1080p) digital video format. It can receive an 8-bit RGB stream with a pixel clock rate up to 170 MHz together with four I2S audio streams when paired with the DS90UB940-Q1/DS90UB948-Q1 deserializer.

#### 8.2 Typical Applications

Bypass capacitors should be placed near the power supply pins. A capacitor and resistor are placed on the PDB pin to delay the enabling of the device until power is stable. See below for typical STP and coax connection diagrams.

#### **Typical Applications (continued)**

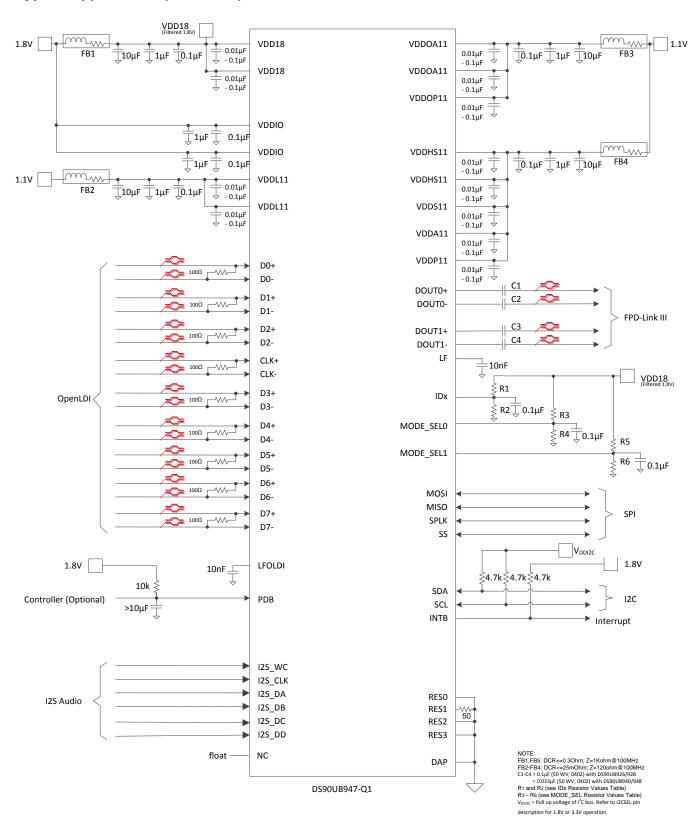

Figure 35. Typical Application Connection -- STP

#### **Typical Applications (continued)**

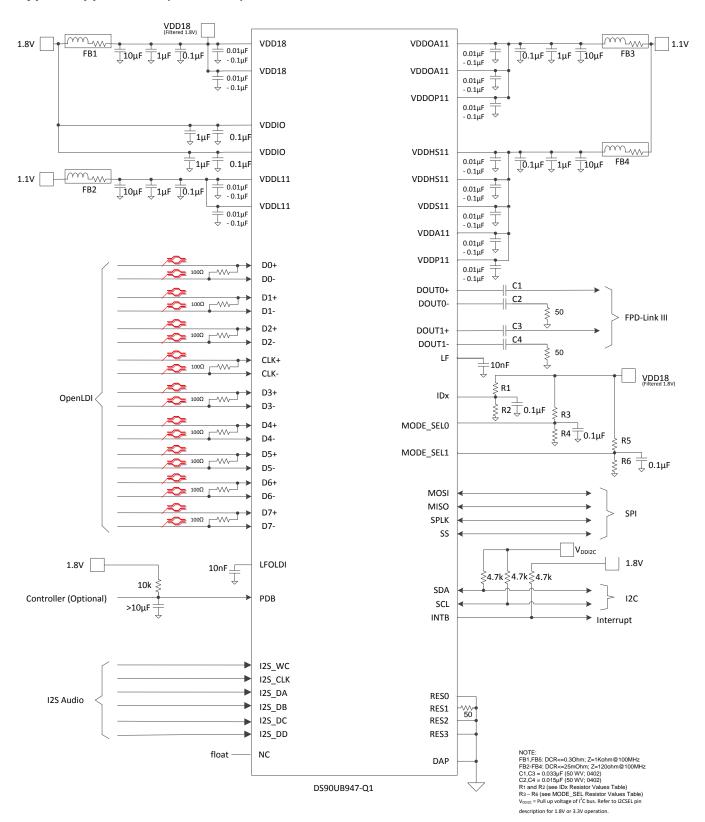

Figure 36. Typical Application Connection -- Coax

#### **Typical Applications (continued)**

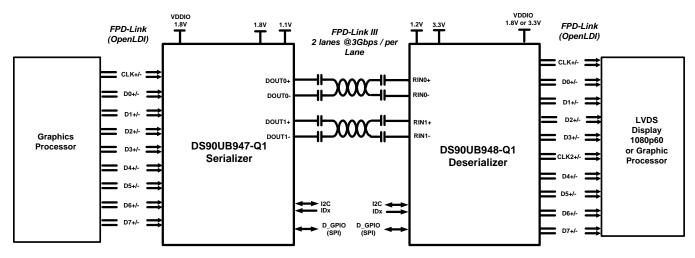

Figure 37. Typical System Diagram

#### 8.2.1 Design Requirements

The SER/DES supports only AC-coupled interconnects through an integrated DC-balanced decoding scheme. External AC coupling capacitors must be placed in series in the FPD-Link III signal path as illustrated in Figure 38.

**Table 12. Design Parameters** 

| DESIGN PARAMETER   | EXAMPLE VALUE |
|--|---------------|
| VDDIO  | 1.8 V         |
| AC Coupling Capacitor for DOUT0± and DOUT1± with 92x deserializers | 100 nF        |
| AC Coupling Capacitor for DOUT0± and DOUT1± with 94x deserializers | 33 nF         |

For applications utilizing single-ended  $50\Omega$  coaxial cable, the unused data pins (DOUT0-, DOUT1-) should utilize a 15nF capacitor and should be terminated with a  $50\Omega$  resistor.

Figure 38. AC-Coupled Connection (STP)

Figure 39. AC-Coupled Connection (Coaxial)

For high-speed FPD-Link III transmissions, the smallest available package should be used for the AC coupling capacitor. This will help minimize degradation of signal quality due to package parasitics.

#### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 High-Speed Interconnect Guidelines

See AN-1108 Channel-Link PCB and Interconnect Design-In Guidelines (SNLA008) and Transmission Line RAPIDESIGNER Operation and Applications Guide (SNLA035) for full details.

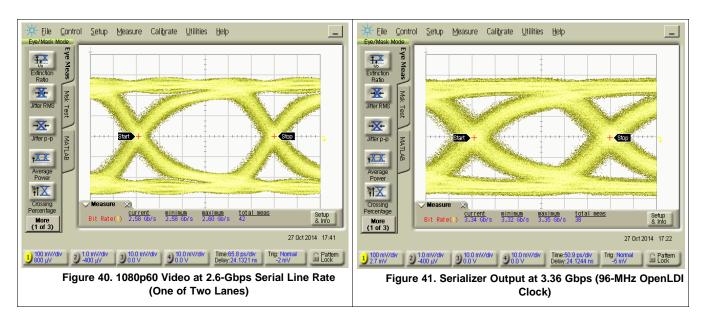

- Use 100-Ω coupled differential pairs
- Use the S/2S/3S rule in spacings
  - S = space between the pair
  - 2S = space between pairs
  - 3S = space to LVCMOS signal
- Minimize the number of Vias
- Use differential connectors when operating above 500Mbps line speed
- Maintain balance of the traces
- · Minimize skew within the pair
- Terminate as close to the TX outputs and RX inputs as possible

Additional general guidance can be found in the LVDS Owner's Manual - available in PDF format from the Texas Instruments web site at: LVDS Owner's Manual (SNLA187).

#### 8.2.3 Application Curves

#### 8.2.3.1 Application Performance Plots

Figure 40 corresponds to 1080p60 video application with 2-lane FPD-Link III output. Figure 41 corresponds to 3.36-Gbps single-lane output from 96-MHz input OpenLDI clock.

#### 9 Power Supply Recommendations

This device provides separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. The Pin Functions table provides guidance on which circuit blocks are connected to which power pins. In some cases, an external filter many be used to provide clean power to sensitive circuits such as PLLs.

#### 9.1 Power-Up Requirements and PDB Pin

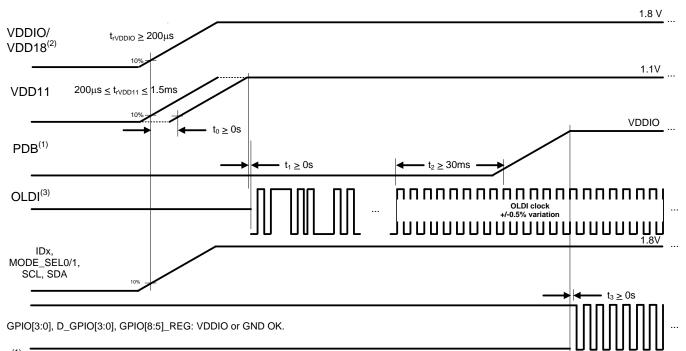

The power supply ramp should be faster than 1.5 ms with a monotonic rise. A large capacitor on the PDB pin is needed to ensure PDB arrives after all the supply pins have settled to the recommended operating voltage. When PDB pin is pulled up to  $V_{DDIO}$ , a 10-k $\Omega$  pull-up and a >10- $\mu$ F capacitor to GND are required to delay the PDB input signal rise. All inputs must not be driven until all power supplies have reached steady state.

The recommended power up sequence is as follows:

- V<sub>DD18</sub>
- V<sub>DD11</sub>
- · Wait until all supplies have settled
- Activate PDB
- Apply OpenLDI input

#### After power up write the following to the device:

```
Reg0x40=0x10 // select OLDI register
Reg0x41=0x49 // force PLL controller in PPM reset state
Reg0x42=0x16
Reg0x41=0x47 // force PLL LOCK Low
Reg0x42=0x20
Reg0x42=0x20
Reg0x42=0x20
Reg0x42=0x20
Reg0x42=0x00 // release PLL LOCK control
Reg0x41=0x49 // release PLL state control
Reg0x42=0x00
```

<sup>(1)</sup> Ti recommends to assert PDB = HIGH with a microcontroller rather than an RC filter network to help ensure proper sequencing of PDB pin after settling of power supplies

Figure 42. Recommended Power Sequencing

<sup>(2)</sup> If VDDIO is applied before VDD18, VDDIO will bias to  $\sim$ 0.750mV

<sup>(3)</sup> Electrical Characteristics of the LVDS should follow TIA/EIA-644-A and OpenLDI specification

## 10 Layout

## 10.1 Layout Guidelines

Circuit board layout and stack-up for the LVDS serializer and deserializer devices should be designed to provide low-noise power to the device. Good layout practice will also separate high frequency or high-level inputs and outputs to minimize unwanted stray noise, feedback and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mil) for power / ground sandwiches. This arrangement utilizes the plane capacitance for the PCB power system and has low-inductance, which has proven effectiveness especially at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range of 0.01  $\mu$ F to 10  $\mu$ F. Tantalum capacitors may be in the 2.2- $\mu$ F to 10- $\mu$ F range. The voltage rating of the tantalum capacitors should be at least 5X the power supply voltage being used.

MLCC surface mount capacitors are recommended due to their smaller parasitic properties. When using multiple capacitors per supply pin, locate the smaller value closer to the pin. A large bulk capacitor is recommended at the point of power entry. This is typically in the  $50\mu F$  to  $100\mu F$  range and will smooth low frequency switching noise. It is recommended to connect power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with via on both ends of the capacitor. Connecting power or ground pins to an external bypass capacitor will increase the inductance of the path. A small body size X7R chip capacitor, such as 0603 or 0805, is recommended for external bypass. A small body sized capacitor has less inductance. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20 MHz to 30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also a common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency.

Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter many be used to provide clean power to sensitive circuits such as PLLs. For DS90UB947-Q1, only one common ground plane is required to connect all device related ground pins.

Use at least a four layer board with a power and ground plane. Locate LVCMOS signals away from the LVDS lines to prevent coupling from the LVCMOS lines to the LVDS lines. Closely coupled differential lines of 100  $\Omega$  are typically recommended for LVDS interconnect. The closely coupled lines help to ensure that coupled noise will appear as common mode and thus is rejected by the receivers. The tightly coupled lines will also radiate less.

At least 9 thermal vias are necessary from the device center DAP to the ground plane. They connect the device ground to the PCB ground plane, as well as conduct heat from the exposed pad of the package to the PCB ground plane. More information on the LLP style package, including PCB design and manufacturing requirements, is provided in the *AN-1187 Leadless Leadframe Package (LLP)* (SNOA401).

# 10.2 Layout Example

Figure 43 is derived from a layout design of the DS90UB947-Q1. This graphic is used to demonstrate proper high-speed routing when designing in the Serializer.

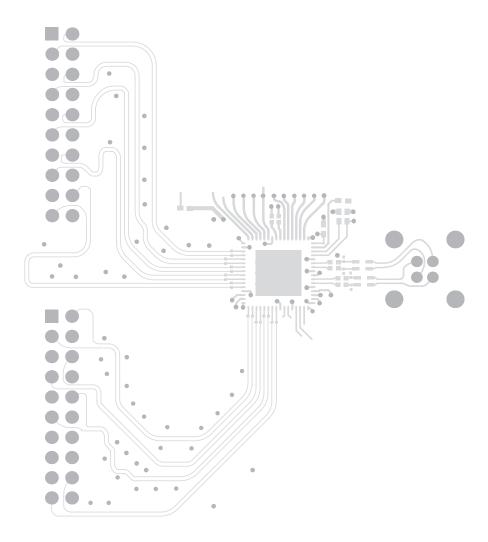

Figure 43. DS90UB947-Q1 Serializer Layout Example

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. 9 x 9, 0.5 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

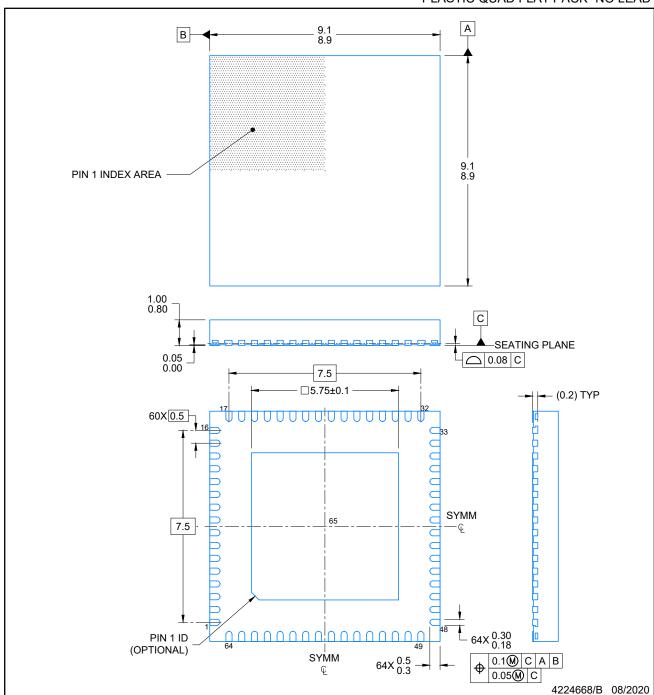

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

4224597/A

PLASTIC QUAD FLAT PACK- NO LEAD

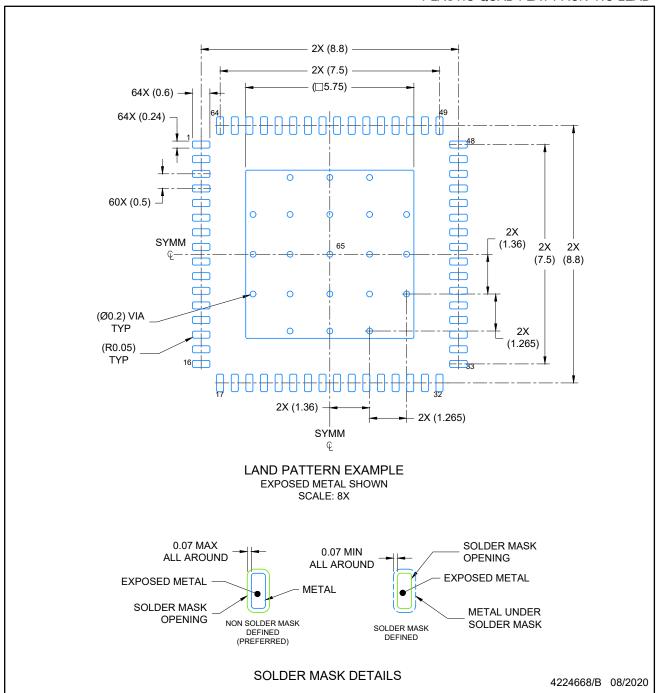

### NOTES:

- All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

PLASTIC QUAD FLAT PACK- NO LEAD

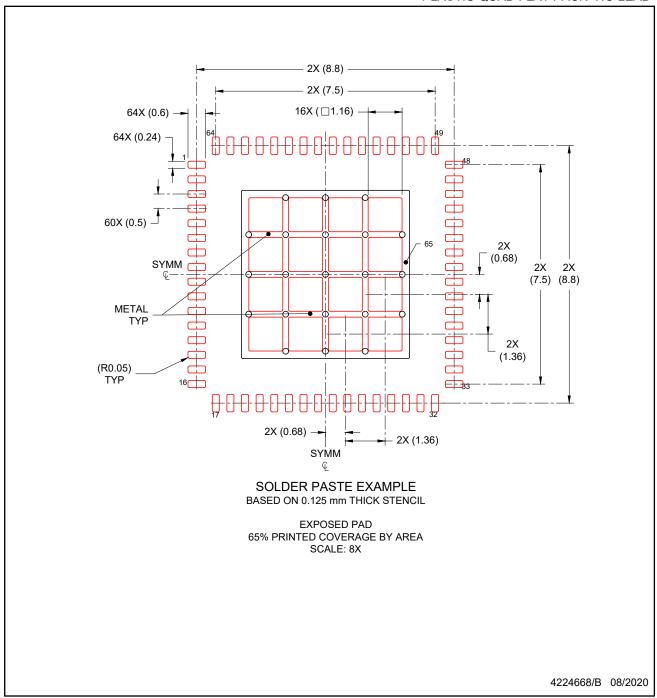

NOTES: (continued)

- 4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- 5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PLASTIC QUAD FLAT PACK- NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## 重要声明和免责声明
