TYPICAL APPLICATION

$$V_{OUT} = 1.25V(1+R_2/R_1) + I_{ADJ}R_2$$

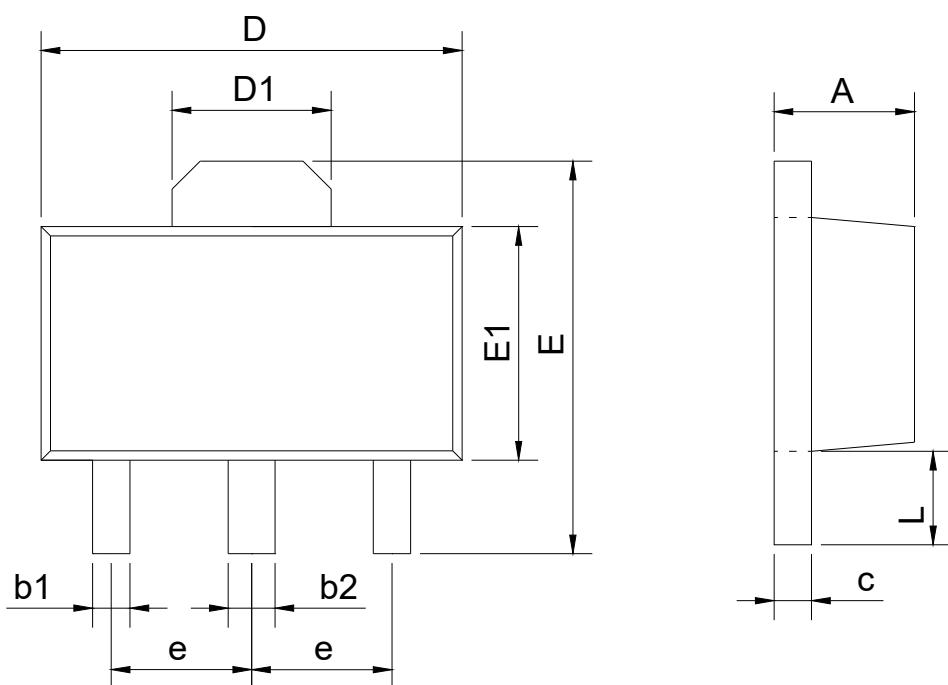

Note 1. C_{IN} is required when regulator is located in appreciable distance from power supply filter.

Note 2. C_{OUT} is not needed for stability, however, it does improve transient response.

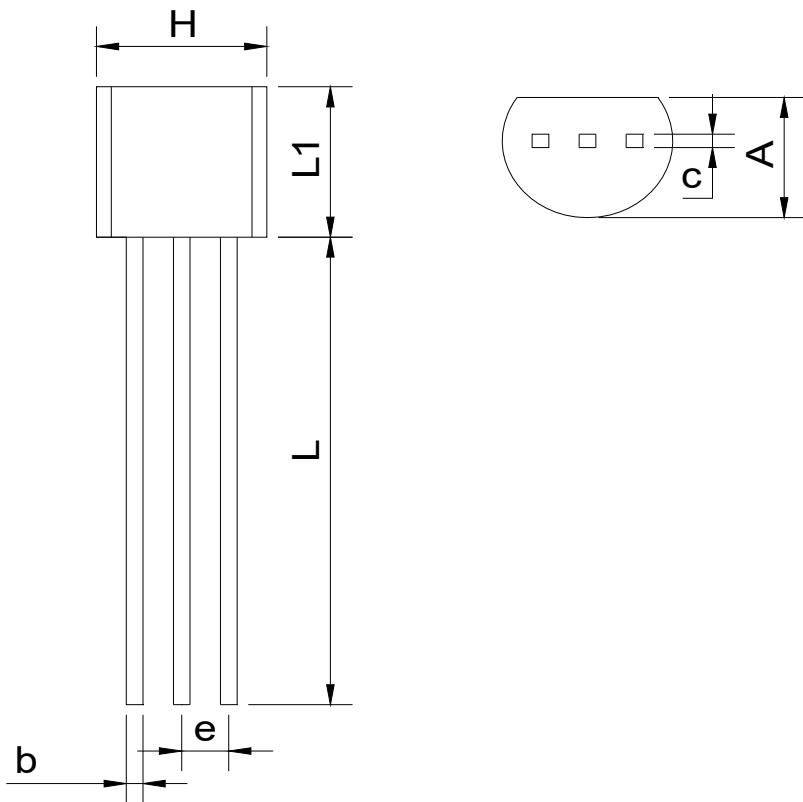

Note 3. I_{ADJ} is controlled to less than 100uA, the error associated with this term is negligible in most applications.
